Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.008$ Å;
R factor = 0.033; wR factor = 0.062; data-to-parameter ratio = 13.3.

The title compound, $[Ho_2(C_9H_9O_3)_6(C_{12}H_8N_2)_2]$, lies about a centre of symmetry and is comprised of six 2-phenoxy-propionate (POPA) anions and two 1,10-phenanthroline (phen) ligands. The two Ho^{III} ions are linked by four POPA groups utilizing both bi- and tridentate bridging modes to form an inversion-symmetric dimer. Each Ho^{III} ion is nine-coordinate, with a chelating 1,10-phenanthroline molecule, one bidentate chelating carboxylate group, two bidentate bridging carboxylate groups and two tridentate bridging carboxylate groups in a distorted mono-capped square antiprism geometry. There are weak $\pi-\pi$ aromatic interactions between the phen groups and aromatic rings of the POPA ligands [centroid–centroid distance = 3.829 (1) Å].

Comment

The group of phenoxyalkanoic acids includes a considerable number of important herbicides. The desired biological activity is largely dependent on the length of the carbon chain of the alkanoic acid, the nature of the phenoxy group, and the position of its attachment to the carbon chain (Markus & Buser, 1997). The fascinating structures of 2-phenoxypropionic acid complexes coupled with their special functionality catch our interests. Recently, we have reported our partial research results (Shen *et al.*, 2011*a,b,c,d*). Here we describe a new Ho^{III} complex.

The structure of the complex is shown in Fig. 1 and the coordination environment of Ho^{III} is shown in Fig. 2. The dimeric title compound is centrosymmetric and is comprised of six *L* and two phen ligands. The two Ho^{III} ions are linked together by four *L* groups by bi- and tridentate bridging modes to form a dimeric unit with crystallographic inversion symmetry. The distance between two Ho^{III} ions is 3.9769 (4) Å, which is similar to analogous complexes (Hu *et al.*, 2006; Zhao *et al.*, 2010). Each Ho^{III} ion is coordinated to nine atoms, of which five are oxygen atoms from bridging carboxylates, two are oxygen atoms from the bidentate chelating carboxylate groups, and two are nitrogen atoms from a 1,10-phenanthroline molecule. The analysis of structural features indicates that the central Ho^{III} ion adopts a distorted mono-capped square antiprism geometry (Fig. 2). The Ho—O distances are all within the range 2.312 (3)–2.618 (3) Å, and the Ho—N distances are 2.500 (3) and 2.594 (3) Å. There are weak π–π aromatic interactions from phen molecules and aromatic rings of the *L* ligands.

Experimental

Reagents and solvents were of commercially available quality and were used without further purification. 2-phenoxypropionic acid (1.5 mmol), Ho(NO₃)₃.6H₂O (0.5 mmol) and 1,10-phenanthroline (0.5 mmol) were dissolved in 20 ml ethanol, then 10 ml water was added. The mixed solution was stirred for 12 h at room temperature. Solid deposits were removed by filtration, and the colourless solution allowed to slowly evaporate in air. Colourless crystals were obtained after several days.

Refinement

The structure was solved by direct methods and successive Fourier difference maps. The H atoms bonded to C and N atoms were positioned geometrically and refined using a riding model [aliphatic C—H = 0.96 Å (*U*_{iso}(H) = 1.5*U*_{eq}(C)), aromatic C—H = 0.93 Å (*U*_{iso}(H) = 1.2*U*_{eq}(C))].

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.062$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.0194P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
6189 reflections	$(\Delta/\sigma)_{\max} = 0.001$
464 parameters	$\Delta\rho_{\max} = 0.67 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.55 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
