Received 9 July 2011; accepted 2 September 2011

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.005$ Å;
 R factor = 0.031; wR factor = 0.086; data-to-parameter ratio = 17.2.

The title compound, $C_{10}H_{10}N_2^{2+}\cdot C_8Br_4O_4^{2-}\cdot 2H_2O$, consists of a tetrabromoterephthalate dianion, a 4,4'-bipyridinium dication and two solvent water molecules. Crystallographic inversion centers are situated at the center of the aromatic ring of the dianion as well as at the midpoint of the carbon–carbon bond connecting the pyridine rings in the dication. In the crystal, intermolecular N–H···O hydrogen-bonding interactions between tetrabromoterephthalate dianions and protonated 4,4'-bipyridinium dications result in the formation of a chain-like structure. Further O–H···O hydrogen bonds between carboxylate O atoms and water molecules lead to the formation of a two-dimensional network in the crystal structure.

4,4'-Bipyridine-1,1'-diium 2,3,5,6-tetrabromoterephthalate dihydrate

H. Kumagai and S. Kawata

Comment

Hydrogen bonded inorganic and organic compounds are of great current interest in recent years due to fundamental scientific and technological applications (Desiraju & Steiner, 1999; Kawata *et al.*, 2002). Here we report the synthesis and single-crystal structure of the title compound $[(\text{C}_8\text{Br}_4\text{O}_4)(\text{C}_{10}\text{H}_{10}\text{N}_2)\cdot 2\text{H}_2\text{O}]$. It consists of a tetrabromoterephthalate dianion, a 4,4'-bipyridinium dication and solvent water molecules. Intermolecular N–H \cdots O hydrogen bonding interactions between tetrabromoterephthalate dianions and protonated 4,4'-bipyridinium dications result in the formation of a one-dimensional chain-like structure. Further O–H \cdots O hydrogen bonds between oxygen atoms of carboxylates and water molecules lead to the formation of a two-dimensional network in the crystal structure.

Experimental

An aqueous solution (2 ml) of cerium nitrate hexahydrate (0.43 g, 1 mmol L^{-1}) was transferred to a glass tube, then a mixture of tetrabromoterephthalic acid (0.48 g, 1 mmol L^{-1}), NaOH (0.08 g, 2 mmol L^{-1}) and 4,4'-bpy (0.15 g, 1 mmol L^{-1}) in ethanol/water (2 ml) was poured into the glass tube without mixing the two solutions. Colorless crystals began to form at ambient temperature during 1 month. One of these crystals was used for X-ray crystallography.

Refinement

Hydrogen atoms bonded to carbon atoms, H1, H2, H3 and H4 were introduced at the positions calculated theoretically and refined using riding models with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$. H5, H6, H7 are located in the Fourier difference maps but the positions of these atoms were not refined. Thermal parameters have been fixed to 1.2 $U_{\text{eq}}(\text{N})$ or 1.5 $U_{\text{eq}}(\text{O})$, respectively.

Figures

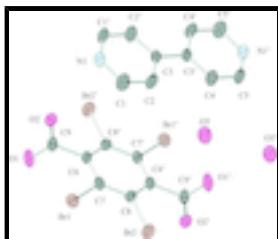

Fig. 1. ORTEP drawing of the title compound showing 50% probability displacement ellipsoids.

$wR(F^2) = 0.086$	H-atom parameters constrained
$S = 1.19$	$w = 1/[\sigma^2(F_o^2) + (0.0449P)^2 + 0.1173P]$
2336 reflections	where $P = (F_o^2 + 2F_c^2)/3$
136 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.48 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -1.55 \text{ e \AA}^{-3}$

Special details

Geometry. ENTER SPECIAL DETAILS OF THE MOLECULAR GEOMETRY

Refinement. Refinement was performed using all reflections. The weighted R -factor (wR) and goodness of fit (S) are based on F^2 . R -factor (gt) are based on F . The threshold expression of $F^2 > 2.0 \sigma(F^2)$ is used only for calculating R -factor (gt).
