Received 22 October 2011; accepted 25 October 2011

Key indicators: single-crystal X-ray study;  $T = 200\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$ ;  $R$  factor = 0.046;  $wR$  factor = 0.115; data-to-parameter ratio = 17.9.

The  $\text{Pd}^{II}$  ion in the title complex,  $[\text{PdCl}_2(\text{C}_{14}\text{H}_{10}\text{N}_4)]$ , is four-coordinated in a distorted square-planar environment defined by two N atoms of a chelating 2,3-di-2-pyridylpyrazine (dpp) ligand and two chloride anions. The pyridine ring coordinated to the Pd atom is inclined slightly to its carrier pyrazine ring [dihedral angle =  $14.4(3)^\circ$ ], whereas the uncoordinated pyridine ring is inclined considerably to the pyrazine ring [dihedral angle =  $52.2(2)^\circ$ ]. The dihedral angle between the two pyridine rings is  $58.8(2)^\circ$ . In the crystal, complex molecules are connected by intermolecular  $\text{C}-\text{H}\cdots\text{Cl}$  and  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bonds, forming a three-dimensional network. Intramolecular  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonds are also present.

### Related literature

For related crystal structures of  $[\text{PtX}_2(\text{dpp})]$  ( $X = \text{Br}, \text{Cl}$ ), see: Ha (2011a,b).

## Dichlorido(2,3-di-2-pyridylpyrazine- $\kappa^2 N^1,N^2$ )palladium(II)

**K. Ha**

### Comment

In the title complex,  $[\text{PdCl}_2(\text{dpp})]$  ( $\text{dpp} = 2,3\text{-di-2-pyridylpyrazine}$ ,  $\text{C}_{14}\text{H}_{10}\text{N}_4$ ), the central  $\text{Pd}^{II}$  ion has a distorted square-planar coordination defined by two N atoms, one from the pyrazine ring and the other from pyridyl ring of the chelating dpp ligand and two  $\text{Cl}^-$  anions (Fig. 1). The complex crystallized in the triclinic space group  $P\bar{1}$ , whereas the previously reported analogous  $\text{Pt}^{II}$  complexes  $[\text{PtX}_2(\text{dpp})]$  ( $X = \text{Br}, \text{Cl}$ ) crystallized in the monoclinic space group  $P2_1/n$  (Ha, 2011a,b).

The tight  $\text{N}1-\text{Pd}1-\text{N}3$  chelate angle of  $80.24$  ( $19$ ) $^\circ$  contributes the distortion of the square, which results in slightly bent *trans* axes [ $\angle \text{Cl}1-\text{Pd}1-\text{N}3 = 174.80$  ( $14$ ) $^\circ$  and  $\angle \text{Cl}2-\text{Pd}1-\text{N}1 = 175.50$  ( $15$ ) $^\circ$ ]. The pairs of  $\text{Pd}-\text{N}$  and  $\text{Pd}-\text{Cl}$  bond lengths are nearly equal, respectively (Table 1). The pyridyl ring coordinated to the  $\text{Pd}$  atom is inclined slightly to its carrier pyrazine ring, making dihedral angle of  $14.4$  ( $3$ ) $^\circ$ . By contrast, the uncoordinated pyridyl ring is inclined considerably to the pyrazine ring forming a dihedral angle of  $52.2$  ( $2$ ) $^\circ$ . The dihedral angle between the two pyridyl rings is  $58.8$  ( $2$ ) $^\circ$ . The complexes are connected by intermolecular  $\text{C}-\text{H}\cdots\text{Cl}$  and  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bonds, forming a three-dimensional network (Fig. 2 and Table 2). There are also intramolecular  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonds (Table 2). The molecules stack in columns along the  $a$  axis and display numerous inter- and intramolecular  $\pi-\pi$  interactions between the six-membered rings, with a shortest ring centroid-centroid distance of  $3.848$  ( $4$ )  $\text{\AA}$ .

### Experimental

The single crystals of the title complex were obtained as a by-product from the reaction of  $\text{Na}_2\text{PdCl}_4$  (0.2960 g, 1.006 mmol) with 2,3-di-2-pyridylpyrazine (0.2361 g, 1.008 mmol) in  $\text{MeOH}$  (30 ml). After stirring of the reaction mixture for 20 h at room temperature, the formed precipitate was separated by filtration, washed with  $\text{MeOH}$ , and dried at  $50$   $^\circ\text{C}$ , to give a yellow powder (0.3560 g). Orange crystals suitable for X-ray analysis were obtained by slow evaporation from an acetone/ $\text{CH}_3\text{NO}_2$  solution of the yellow product.

### Refinement

H atoms were positioned geometrically and allowed to ride on their respective parent atoms [ $\text{C}-\text{H} = 0.95$   $\text{\AA}$  and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ]. The highest peak ( $1.18$  e  $\text{\AA}^{-3}$ ) and the deepest hole ( $-2.09$  e  $\text{\AA}^{-3}$ ) in the final difference Fourier map are located  $0.74$   $\text{\AA}$  and  $0.88$   $\text{\AA}$  from the  $\text{N}1$  and  $\text{Pd}1$  atoms, respectively.

$\gamma$ = 71.475 (2)°	0.26 × 0.16 × 0.12 mm
$V$ = 708.81 (15) Å <sup>3</sup>	

### Data collection

Bruker SMART 1000 CCD diffractometer	3406 independent reflections
Radiation source: fine-focus sealed tube graphite	2608 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.025$
Absorption correction: multi-scan (SADABS; Bruker, 2000)	$\theta_{\text{max}} = 28.3^\circ$ , $\theta_{\text{min}} = 2.1^\circ$
$T_{\text{min}} = 0.748$ , $T_{\text{max}} = 1.000$	$h = -10 \rightarrow 10$
5225 measured reflections	$k = -12 \rightarrow 11$
	$l = -12 \rightarrow 13$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.115$	H-atom parameters constrained
$S = 1.24$	$w = 1/[\sigma^2(F_o^2) + (0.P)^2 + 3.5422P]$
3406 reflections	where $P = (F_o^2 + 2F_c^2)/3$
190 parameters	$(\Delta/\sigma)_{\max} < 0.001$
0 restraints	$\Delta\rho_{\max} = 1.18 \text{ e \AA}^{-3}$
	$\Delta\rho_{\min} = -2.09 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
