Received 26 September 2011; accepted 28 September 2011

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.041; wR factor = 0.122; data-to-parameter ratio = 24.9.

In the title compound, $\text{C}_{16}\text{H}_{15}\text{ClN}_2\text{OS}$, the hydrazine group is twisted slightly: the $\text{C}-\text{N}-\text{N}-\text{C}$ torsion angle is 175.46 (13)°. The dihedral angle between the two terminal aromatic rings is 87.01 (8)°. In the crystal, inversion dimers linked by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds generate $R_2^2(8)$ loops. The dimers are further linked by weak $\text{C}-\text{H}\cdots\pi$ interactions.

N'-(4-Chlorobenzylidene)-2-[4-(methylsulfonyl)phenyl]acetohydrazide

H.-K. Fun, M. Hemamalini, V. Sumangala, D. J. Prasad and B. Poojary

Comment

Large number of aroylhydrazones have been synthesized in the recent years (Li & Qu, 2011; Zhang, 2011; Fan *et al.*, 2010) which can serve as intermediates in synthesizing biologically active compounds (Ajani *et al.*, 2010; Avaji *et al.*, 2009; Rasras *et al.*, 2010).

The asymmetric unit of the title compound is shown in Fig. 1. The hydrazine group is twisted slightly, with C7-N1-N2-C8, N1-N2-C8-C9 and N2-N1-C7-C6 torsion angles of 175.46 (13)°, 5.6 (2)° and -177.96 (12)°, respectively. The dihedral angle between the two terminal (C1–C6/C10–C15) phenyl rings is 87.01 (8)°.

In the crystal structure, (Fig. 2), centrosymmetrically related molecules are linked into dimers *via* pairs of intermolecular N2—H1N2···O1 (Table 1) hydrogen bonds, generating $R_2^2(8)$ ring motifs (Bernstein *et al.*, 1995). The crystal structure is further stabilized by C—H··· π interactions involving the centroids of the C1–C6 (Cg1) and C10–C15 (Cg2) rings.

Experimental

An equimolar mixture of 2-(4-methylsulfonylphenyl)acetohydrazide and 4-chlorobenzaldehyde was refluxed for four hours in the presence of few drops of acid catalyst and ethanol as solvent. The compound obtained was filtered, washed, dried and recrystallised from ethanol to yield colourless plates.

Refinement

All hydrogen atoms were positioned geometrically [N–H = 0.9458 Å and C–H = 0.93–0.97 Å] and were refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5 U_{\text{eq}}(\text{C})$. A rotating group model was applied to the methyl groups.

Figures

Fig. 1. The asymmetric unit of the title compound, showing 50% probability displacement ellipsoids.

Fig. 2. The crystal packing of the title compound (I). H atoms not involved in hydrogen bonding are omitted.

Data collection

Bruker APEXII DUO CCD diffractometer	4748 independent reflections
Radiation source: fine-focus sealed tube graphite	3306 reflections with $I > 2\sigma(I)$
φ and ω scans	$R_{\text{int}} = 0.025$
Absorption correction: multi-scan (<i>SADABS</i> ; Bruker, 2009)	$\theta_{\text{max}} = 30.3^\circ$, $\theta_{\text{min}} = 2.4^\circ$
$T_{\text{min}} = 0.728$, $T_{\text{max}} = 0.967$	$h = -24 \rightarrow 24$
17083 measured reflections	$k = -13 \rightarrow 13$
	$l = -9 \rightarrow 13$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.041$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.122$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0504P)^2 + 0.3224P]$
4748 reflections	where $P = (F_o^2 + 2F_c^2)/3$
191 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.41 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.41 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between

s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 and Cg2 are the centroids of the C1—C6 and C10—C15 rings, respectively.
