Received 24 October 2011; accepted 24 October 2011

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.054; wR factor = 0.193; data-to-parameter ratio = 14.1.

A nearly orthogonal relationship is found for the ring systems in the title compound, $\text{C}_{15}\text{H}_{10}\text{N}_2\text{O}_3$, with the dihedral angle between the rings being $86.13(11)^\circ$. The nitro group is approximately coplanar with the pyridine ring to which it is connected [the O–N–C–C torsion angle = $-1.8(4)^\circ$]. This coplanarity allows for the close approach of these residues in the crystal structure enabling the formation of N–O $\cdots\pi$ (pyridine) interactions [3.547(4) Å]. Further consolidation of the crystal packing is afforded by weak π – π interactions [centroid–centroid distances = 3.9576(16) and 3.9822(16) Å].

Comment

In continuation of structural studies of nitro-pyridine derivatives (Nasir *et al.*, 2010), the title compound was synthesized and characterized crystallographically. The molecule of (I), Fig. 1, is highly twisted as seen in the near orthogonal relationship between the two ring systems with the dihedral angle formed between the nitro-pyridine ring and naphthalyl ring being $86.13(11)^\circ$. The nitro group is co-planar with the pyridyl ring to which it is attached with the O2—N2—C4—C3 torsion angle being $-1.8(4)^\circ$.

The most prominent feature of the crystal packing appears to be N—O \cdots π interactions (Huang *et al.*, 2008). The distance between O3 \cdots π (pyridyl) = 3.547(4) Å, with the N2—O3 \cdots ring centroid(pyridyl)ⁱ angle = $81.9(2)^\circ$ for symmetry operation *i*: 1 - *x*, 1 - *y*, 1 - *z*. Similar interactions were reported in the crystal structure of 2-(4-methoxyphenoxy)-3-nitropyridine (Nasir *et al.*, 2010). In (I), the N—O \cdots π interactions along with weak π – π interactions, whereby both rings of the naphthalyl residue interact with the pyridyl ring, consolidate the crystal packing. The parameters associated with the π – π interactions are ring centroid(pyridyl) \cdots ring centroid(C6–C11) and (C10–C15) = 3.9822(16) and 3.9576(16) Å, respectively, for *ii*: 1 - *x*, -1/2 + *y*, 3/2 - *z*. A view of the crystal packing is shown in Fig. 2.

Experimental

2-Naphthol (2.88 g, 20 mmol) and sodium hydroxide (0.80 g, 20 mmol) were dissolved in water (50 ml) and to the solution was added 2-chloro-5-nitropyridine (3.17 g, 20 mmol) dissolved in THF (50 ml). The mixture was heated for 7 h. Water was added and the organic phase extracted with chloroform. The chloroform solution was dried over sodium sulfate; slow evaporation led to the formation of colourless crystals.

Refinement

Hydrogen atoms were placed at calculated positions (C—H 0.93 Å) and were treated as riding on their parent carbon atoms, with $U(\text{H})$ set to $1.2U_{\text{eq}}(\text{C})$. The naphthalene fused-ring was refined as two fused hexagons with C=C distances fixed at 1.39 Å.

Figures

Fig. 1. The molecular structure of (I) showing the atom-labelling scheme and displacement ellipsoids at the 35% probability level.

Fig. 2. Unit-cell contents for (I) shown in projection down the a axis. The N—O... π and π - π interactions are shown as orange and purple dashed lines, respectively.
