Key indicators: single-crystal X-ray study; $T = 173$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.022; wR factor = 0.058; data-to-parameter ratio = 13.4.

In the binuclear title compound, $[Ag_2(C_{11}H_{11}N_3)_2](CF_3O_3S)_2$, the complex cation is centrosymmetric, with the unique Ag^+ cation coordinated by two pyridine N atoms from two symmetry-related N-(pyridin-2-ylmethyl)pyridin-2-amine ligands in a geometry slightly distorted from linear [N—Ag—N 161.02 (7)]. This set-up leads to the formation of a 14-membered cyclic dimer. The two pyridine rings coordinated to the Ag^+ cation are tilted by 80.19 (7)° with respect to each other. Intermolecular N—H···O hydrogen-bonding interactions between the cyclic dimer and the anion exist. A two-dimensional network parallel to the *ac* plane is constructed by three weak Ag···(O,N) interactions as well as an F···F contact of 2.890 (4) Å.

Bis[μ -N-(pyridin-2-ylmethyl)pyridin-2-amine- κ^2 N:N']disilver(I) bis(trifluoromethanesulfonate)

S.-H. Moon, T. H. Kim and K.-M. Park

Comment

The dipyridyl ligand *N*-(pyridin-2-ylmethyl)pyridin-2-amine has been synthesized by the reaction of 2-aminopyridine and 2-pyridinecarboxaldehyde according to literature (Foxon *et al.*, 2002) and its crystal structure was already reported by our group (Moon *et al.*, 2011). In the reaction of the ligand and CuX ($X=I$ and Br), two-dimensional brick-wall type coordination polymers, in which rhomboid Cu₂X₂ nodes interconnect the dipyridyl ligands, were obtained (Lee *et al.*, 2008). Herein, we report the crystal structure of the title compound prepared by the reaction of silver trifluoromethanesulfonate with the dipyridyl ligand.

The binuclear cation of the title compound, [Ag₂(C₁₁H₁₁N₃)₂](CF₃SO₃)₂, is located on an inversion centre. The asymmetric unit of the compound therefore consists of a Ag⁺ cation, an *N*-(pyridin-2-ylmethyl)pyridin-2-amine ligand and a trifluoromethanesulfonate anion. The two Ag⁺ cations, each in a geometry slightly distorted from linear (N—Ag—N 161.02 (7) $^\circ$), are coordinated by two pyridine N atoms from two symmetry-related *N*-(pyridine-2-ylmethyl)pyridine-2-amine ligands, leading to the formation of a centrosymmetric 14-membered cyclic dimer (Fig. 1). Two pyridine rings coordinated to the Ag⁺ cations are tilted by 80.19 (7) $^\circ$ with respect to each other.

The non-coordinated CF₃SO₃⁻ anions participate in N—H \cdots O hydrogen-bonding (Table 1, Fig. 1) and weak Ag \cdots O interactions, as well as an F \cdots F contact of 2.890 (4) Å. Together with another weak Ag—N contact, this leads to the construction of a two-dimensional network extending parallel to the *ac* plane (Fig. 2).

Experimental

The ligand (*N*-(pyridine-2-ylmethyl)pyridine-2-amine) was synthesized according to a procedure described by Foxon *et al.* (2002). Crystals of the title compound suitable for X-ray analysis were obtained by vapor diffusion of diethyl ether into a DMSO solution of the white precipitate afforded by the reaction of the ligand with silver(I) trifluoromethanesulfonate in the molar ratio 1:1 in methanol.

Refinement

All H atoms were positioned geometrically and refined using a riding model, with d(C—H) = 0.95 Å for Csp²—H, 0.88 Å for amine N—H and 0.99 Å for methylene C—H. For all H atoms $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$.

supplementary materials

Figures

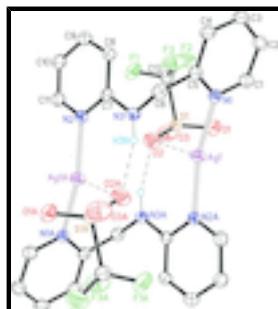

Fig. 1. The molecular structure of the title compound, with displacement ellipsoids drawn at the 50% probability level. H atoms not involved in intermolecular interactions have been omitted for clarity. H atoms are depicted as spheres with arbitrary radii; N–H···O hydrogen bonds and Ag···O interactions are shown as dashed lines. (Symmetry code: (A) $-x + 2, -y + 1, -z + 1$)

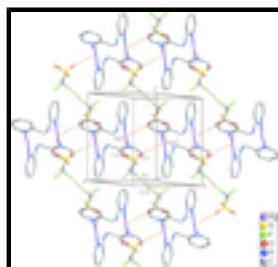

Fig. 2. Two-dimensional network constructed by intermolecular Ag···O and F···F interactions shown as dashed lines. H atoms have been omitted for clarity. (Symmetry codes: i) $-x + 1, -y + 1, -z + 1$; ii) $-x + 1, -y + 1, -z$)

208 parameters	$\Delta\rho_{\max} = 0.52 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.58 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
