Received 1 October 2011; accepted 1 November 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$;
 R factor = 0.039; wR factor = 0.070; data-to-parameter ratio = 14.9.

In the title compound, $(\text{C}_{10}\text{H}_{10}\text{N}_3\text{O}_2\text{S})_2[\text{CdCl}_4]$, the Cd^{II} ion lies on a twofold axis and is coordinated by four chloride anions, with bond distances of 2.4787 (10) and 2.4410 (10) \AA . A chain along the c axis is formed by $\text{C}-\text{H}\cdots\text{N}$ hydrogen-bonding interactions and a weak $\pi-\pi$ interaction is observed between the pyrimidine rings of two adjacent parallel chains [centroid–centroid distance = 3.722 (2) \AA]. $\text{N}-\text{H}\cdots\text{Cl}$, $\text{CN}-\text{H}\cdots\text{Cl}$ and $\text{N}-\text{H}\cdots\text{O}$ interactions also occur.

Bis{3-[2-(methylsulfonyl)pyrimidin-4-yl]pyridinium} tetrachloridocadmium

D. Hu and X. Liu

Comment

Crystal engineering of coordination compounds has attracted a great deal of attention in the recent years because of their potential as functional materials (Huang *et al.*, 2001; Dong *et al.*, 2008, 2009). One of the most efficient and powerful strategies for constructing such compounds is directed self-assembly of designed organic ligands and inorganic metal ions. Although self-assembly directed by metal-containing species is mainly assisted by coordination bond-base approach, other non-covalent interactions such as hydrogen bonding and aromatic π - π stacking also have a significant impact on the architecture of the final product. One example is the dinuclear Zn^{II} macrocyclic species reported by Huang *et al.* (2001). Here we describe the Cd^{II} title complex.

The title compound crystallizes in the monoclinic space group *C*2/c and every unit cell contains four Cd^{II} ions, eight 3-(2-methanesulfonyl-pyrimidin-4-yl)pyridinium cations (*L*) and sixteen chloride anions (Fig 1). Each Cd(II) ion is coordinated by four chloride anions, yielding a distorted tetrahedral coordination sphere with Cd—Cl1 and Cd—Cl2 distances in the range of 2.44–2.48 Å and the corresponding Cl2—Cd—Cl1 bond angles are 112.64 (5) $^\circ$ (Cl2A—Cd1—Cl2), 111.85 (4) $^\circ$ (Cl2A—Cd1—Cl1), 102.49 (3) $^\circ$ (Cl2—Cd1—Cl1) and 102.49 (3) $^\circ$ (Cl2A—Cd1—Cl1A), respectively. A one-dimensional chain is formed by C7—H7···N2 hydrogen bonding interactions, as can be seen in Fig. 2; the corresponding bond length and bond angle are 3.474 (5) Å and 162 $^\circ$, respectively. A weak π — π interaction is observed between the pyrimidyl rings of two adjacent paralleled one-dimensional chains with the centroid-centroid separation of 3.722 (2) Å. A Cd₂(HL)₄Cl₈ structural unit, as the result of C—H···Cl hydrogen bonding interaction, is formed and shown in Fig. 3, where the corresponding bond lengths and bond angles are 3.552 (6) Å, 143 $^\circ$ (C10—H10A···Cl1); 3.603 (4) Å, 146 $^\circ$ (C2—H2···Cl1); 3.577 (3) Å, 153 $^\circ$ (C6—H6···Cl2) and 3.062 (4) Å, 170 (3) $^\circ$ (N3—H3A···Cl1), respectively.

Experimental

All solvents and chemicals were of analytical grade and were purchased from Aldrich or ACROS. They were used without further purification. For the synthesis of the title compound, a solution of CdCl₄ (6.4 mg, 0.025 mmol) in methanol (5 mL) was very slowly dropped on the top of a solution of *L* (11.76 mg, 0.05 mmol) in chloroform (5 mL) in a tube. Pale yellow single crystals formed after six days.

Refinement

All hydrogen atoms were geometrically positioned (C—H 0.93–0.97 Å) and refined in riding motion, with $U_{\text{iso}}(\text{H})=1.2\text{--}1.5$ U_{eq} of the parent atom. Proton H3a was refined freely.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.070$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.90$	$w = 1/[\sigma^2(F_o^2) + (0.0212P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2576 reflections	$(\Delta/\sigma)_{\max} < 0.001$
173 parameters	$\Delta\rho_{\max} = 0.77 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.41 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
