Received 26 October 2011; accepted 7 November 2011

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  
 $R$  factor = 0.056;  $wR$  factor = 0.095; data-to-parameter ratio = 10.9.

In the title compound,  $\text{C}_9\text{H}_8\text{N}_2$ , a mirror plane lies perpendicular to the phenyl and imidazole rings and passes through the bridging  $\text{C}-\text{C}$  bond, so that the imidazole ring is disordered over two sites about the mirror plane with the equal site occupancy; the asymmetric unit contains one half-molecule. In the crystal, adjacent molecules are linked via  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds.

### Related literature

### Comment

2-Phenylimidazole, as an important compound with potential N donor atom that may contribute in classical hydrogen bonding in generation of supramolecular assemblies. There are some crystal structure reports that show 2-phenylimidazole can be protonated (Xia *et al.*, 2009; Xia & Yao, 2010).

The asymmetric unit of the title compound contains one half-molecule, a mirror plane passes through the C—C connecting two rings (Fig. 1). In this molecule the bond lengths and angles are within normal ranges. The imidazole and phenyl rings are nearly co-planar. The intermolecular N—H···N hydrogen bonds (Table 1) occurs in the crystal structure (Table 1).

### Experimental

The title compound has been obtained during the stirring of 2-phenyl-1*H*-imidazole and aniline in 1:1 molar ration in methanol for synthesis of co-crystal of reagents. The suitable crystals for X-ray analysis were obtained by slow evaporation from methanol solution after one week (yield: 86.5%).

### Refinement

All of the H atoms were positioned geometrically with C—H = 0.93 and N—H = 0.86 Å, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$ . The molecule is disordered over two sites in the crystal structure and H1B atom is in 50% occupancy. Friedel pairs were merged as no significant anomalous scatterings.

### Figures

## 2-Phenyl-1*H*-imidazole

### Crystal data

C <sub>9</sub> H <sub>8</sub> N <sub>2</sub>	<i>F</i> (000) = 304
<i>M<sub>r</sub></i> = 144.17	<i>D<sub>x</sub></i> = 1.26 Mg m <sup>-3</sup>
Orthorhombic, <i>Ama</i> 2	Mo <i>Kα</i> radiation, $\lambda$ = 0.71073 Å
Hall symbol: A 2 -2a	Cell parameters from 1776 reflections
<i>a</i> = 10.0740 (15) Å	$\theta$ = 3.0–29.1°
<i>b</i> = 18.151 (4) Å	$\mu$ = 0.08 mm <sup>-1</sup>
<i>c</i> = 4.1562 (10) Å	<i>T</i> = 298 K
<i>V</i> = 760.0 (3) Å <sup>3</sup>	Prism, colorless
<i>Z</i> = 4	0.17 × 0.12 × 0.10 mm

### Data collection

Stoe IPDS 2T diffractometer	<i>R</i> <sub>int</sub> = 0.082
graphite	$\theta_{\text{max}} = 29.1^\circ$ , $\theta_{\text{min}} = 3.0^\circ$
rotation method scans	<i>h</i> = -13→11
1776 measured reflections	<i>k</i> = -19→24
609 independent reflections	<i>l</i> = -5→4
304 reflections with $I > 2\sigma(I)$	

### Refinement

Refinement on <i>F</i> <sup>2</sup>	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
<i>R</i> [ $F^2 > 2\sigma(F^2)$ ] = 0.056	H-atom parameters constrained
<i>wR</i> ( $F^2$ ) = 0.095	$w = 1/[\sigma^2(F_o^2) + (0.0288P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
<i>S</i> = 0.98	$(\Delta/\sigma)_{\text{max}} = 0.001$
609 reflections	$\Delta\rho_{\text{max}} = 0.14 \text{ e \AA}^{-3}$
56 parameters	$\Delta\rho_{\text{min}} = -0.09 \text{ e \AA}^{-3}$
1 restraint	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008)
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.009 (3)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
