Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.063; wR factor = 0.216; data-to-parameter ratio = 20.7.

In the title compound, $\text{C}_{29}\text{H}_{20}\text{F}_3\text{NO}_3\text{S}$, the thiazolidine ring adopts a half-chair conformation. The pyrrolidine and two five-membered carbocyclic rings are in envelope conformations with the spiro C atoms at the flaps. The trifluoromethyl-substituted benzene ring forms dihedral angles of $62.37(14)$ and $87.40(14)^\circ$ with the benzene rings of the dihydro-1*H*-indene units. The two benzene rings form a dihedral angle of $36.94(15)^\circ$. The molecular structure is stabilized by intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, which generate *S*(6) ring motifs. In the crystal, molecules are linked into inversion dimers by pairs of intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, generating $R_2^2(10)$ ring motifs.

Comment

As part of our ongoing search for novel heterocyclic compounds with antitubercular activity (Wei, Ali, Choon *et al.*, 2011*a,b*; Wei, Ali, Ismail *et al.*, 2011; Wei, Ali, Yoon *et al.*, 2011), our group has synthesized the title compound as described below.

The molecular structure is shown in Fig. 1. The thiazolidine (S1/N1/C27-C29) ring is twisted about the S1—C28 bond, with puckering parameters (Cremer & Pople, 1975) $Q = 0.405$ (3) Å and $\varphi = 204.5$ (4)°, thereby adopting a half-chair conformation. The pyrrolidine (N1/C9/C10/C19/C27) and two five-membered carbocyclic (C1/C2/C7-C9 and C10-C12/C17/C18) rings are in envelope conformations, puckering parameters (Cremer & Pople, 1975) $Q = 0.458$ (2) Å and $\varphi = 65.6$ (3)° with atom C10 at the flap; $Q = 0.178$ (3) Å and $\varphi = 322.2$ (8)° with atom C9 at the flap; and $Q = 0.202$ (3) Å and $\varphi = 352.7$ (8)° with atom C10 at the flap, respectively. Bond lengths (Allen *et al.*, 1987) and angles are within normal ranges and are comparable to related structures (Kumar *et al.*, 2010; Wei, Ali, Choon *et al.*, 2011*a,b*; Wei, Ali, Ismail *et al.*, 2011; Wei, Ali, Yoon *et al.*, 2011). The trifluoromethyl-bound benzene (C20–C25) ring forms dihedral angles of 62.37 (14) and 87.40 (14)° with the other two benzene (C2–C7 and C12–C17) rings, respectively. The two benzene rings form a dihedral angle of 36.94 (15)°. The molecular structure is stabilized by intramolecular C18—H18A···O2 and C19—H19A···O1 hydrogen bonds (Table 1), which generate S(6) ring motifs (Fig. 1; Bernstein *et al.*, 1995).

In the crystal (Fig. 2), molecules are linked into inversion dimers by pairs of intermolecular C3—H3A···O1 hydrogen bonds (Table 1), generating ten-membered R₂²(10) ring motifs (Bernstein *et al.*, 1995).

Experimental

A mixture of (*Z*)-2-(4-trifluoromethylbenzylidene)-2,3-dihydro-1*H*-indene-1-one (0.001 mmol), ninhydrin (0.001 mmol) and thiazolidine -4-carboxylic acid (0.002 mmol) (1:1:2) were dissolved in methanol (10 ml) and refluxed for 4 h. After completion of the reaction as evident from TLC, the mixture was poured into crushed ice. The precipitated solid was filtered, washed with water and recrystallised from petroleum ether-ethyl acetate mixture (1:1) to reveal the title compound as yellow crystals.

Refinement

All H atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.98 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.063$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.216$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.1159P)^2 + 0.3319P]$
6922 reflections	where $P = (F_o^2 + 2F_c^2)/3$
334 parameters	$(\Delta/\sigma)_{\max} = 0.001$
0 restraints	$\Delta\rho_{\max} = 0.73 \text{ e } \text{\AA}^{-3}$
	$\Delta\rho_{\min} = -0.69 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
