Received 18 October 2011; accepted 9 November 2011

Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.033; wR factor = 0.108; data-to-parameter ratio = 17.9.

In the title compound, $\text{C}_8\text{H}_7\text{ClN}_4\text{S}_2$, the thiazole ring is essentially planar [r.m.s. deviation = 0.0011 (2) \AA] and conformation of the thiazolidine ring is twisted on the $\text{C}-\text{C}$ bond. The $\text{C}=\text{N}$ bond has a *Z* configuration.

Related literature

The title compound was synthesized as an intermediate for the preparation of pesticides. For the biological activity of this class of compounds, see: Zhang *et al.* (2000); Kagabu *et al.* (2008). For the synthesis, see: Kozo *et al.* (1987); Zuo *et al.* (2008). For a related structure, see Li *et al.* (2010).

Experimental

Comment

It is already known that certain cyanoimino-substituted heterocyclic compounds are useful as intermediates in the preparation of pesticides which have played a major role in eliminating insects such as aphids, leafhoppers and whiteflies (Kagabu *et al.*, 2008; Zhang *et al.*, 2000). The molecular structure of the title compound is shown in Fig. 1. The thiazole ring is essentially planar (r.m.s. deviations 0.0011 (2) Å) and the thiazolidine ring is in a slight half-chair conformation. The C=N bond with a Z configuration has a bond length of 1.150 (4) Å, which is in agreement with that in a related structure (Li *et al.*, 2010).

Experimental

The synthesis of the title compound follows the method of Kozo *et al.* (1987) and Zuo, *et al.* (2008). (Z)-2-(1,3-Thiazolidin-2-ylidene)cyanamide 12.7 g (0.1 mol) and potassium carbonate 41.4 g (0.3 mol) were dissolved in *N,N*-dimethylformamide (DMF) (75 ml), then 2-chloro-5-thiazolylmethyl chloride 17.4 g (0.102 mol) dissolved in DMF (40 ml) was added dropwise. The mixture was stirred for 0.5 h at room temperature and filtered. The filtrate was concentrated and further purified by column chromatography to obtain the title product (13.9 g) with a yield of 53.7%. Colorless crystals were obtained by slow evaporation of a tetrahydrofuran solution of the title compound at room temperature.

¹H NMR (300 MHz, DMSO-d6): δ (p.p.m.) 7.71 (1H, s), 4.79 (2H, s), 3.92 (2H, t, *J* = 15.3 Hz, *J* = 7.65 Hz); 3.49 (2H, t, *J* = 15.3 Hz, *J* = 7.65 Hz).

Refinement

All H atoms were placed in calculated positions, with C—H = 0.93–0.97 Å and included in the final cycles of refinement using a riding model, with *U*_{iso}(H) = 1.2 *U*_{eq}(C).

Figures

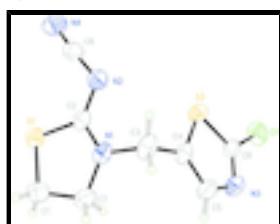

Fig. 1. The molecular structure of the title compound showing displacement ellipsoids at the 40% probability level.

Z = 4	

Data collection

Bruker SMART CCD diffractometer	2440 independent reflections
Radiation source: fine-focus sealed tube graphite	2075 reflections with $I > 2\sigma(I)$
φ and ω scans	$R_{\text{int}} = 0.015$
Absorption correction: multi-scan (<i>SADABS</i> ; Sheldrick, 1996)	$\theta_{\max} = 27.5^\circ$, $\theta_{\min} = 2.4^\circ$
$T_{\min} = 0.901$, $T_{\max} = 0.932$	$h = -12 \rightarrow 12$
6191 measured reflections	$k = -11 \rightarrow 14$
	$l = -13 \rightarrow 13$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.108$	H-atom parameters constrained
$S = 0.98$	$w = 1/[\sigma^2(F_o^2) + (0.0632P)^2 + 0.5077P]$
2440 reflections	where $P = (F_o^2 + 2F_c^2)/3$
136 parameters	$(\Delta/\sigma)_{\max} < 0.001$
0 restraints	$\Delta\rho_{\max} = 0.38 \text{ e Å}^{-3}$
	$\Delta\rho_{\min} = -0.27 \text{ e Å}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
