Received 21 October 2011; accepted 15 November 2011

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.007$  Å; disorder in main residue;  $R$  factor = 0.089;  $wR$  factor = 0.203; data-to-parameter ratio = 16.4.

In the title molecule,  $C_{17}H_{23}N_2O_2P$ , the P atom has a distorted tetrahedral environment. The P–N bond to the tolylamido fragment is 1.642 (4) Å while that to the butylamido fragment is 1.629 (3) Å. The dihedral angle between the two benzene rings is 82.3 (2)°. In the crystal, adjacent molecules are linked via weak N–H···(O)P and N–H···N hydrogen-bonding interactions into an extended chain parallel to the  $b$  axis. The three methyl groups of the *tert*-butylamido substituent are disordered over two sets of sites with equal occupancies. The crystal studied was found to be a non-merohedral twin with the minor twin component = 23.1 (1)%.

### **O-Phenyl (*tert*-butylamido)(*p*-tolylamido)phosphinate**

**M. Pourayoubi, A. L. Rheingold, C. Chen, F. Karimi Ahmadabad and A. Tarahhomí**

#### **Comment**

Following our previous work on the synthesis of mixed-amido phosphinates containing a P(O)(O)(NH)(NH) skeleton (Pourayoubi *et al.*, 2011a), we report here on the synthesis and crystal structure of the title compound, P(O)[OC<sub>6</sub>H<sub>5</sub>][NHC<sub>6</sub>H<sub>4</sub>(4-CH<sub>3</sub>)][NHC(CH<sub>3</sub>)<sub>3</sub>] (Fig. 1).

The P=O, P—O and P—N bond lengths and P—O—C and P—N—C bond angles are within the expected values (Sabbaghi *et al.*, 2011). The P atom has a distorted tetrahedral conformation with the bond angles in the range of 96.76 (17) $^{\circ}$  [O2—P1—N2] to 117.03 (17) $^{\circ}$  [O1—P1—N2]. The P1—N1 bond (with length of 1.642 (4) Å) is slightly longer than the P1—N2 bond (1.629 (3) Å). The dihedral angle between the phenyl rings of the OC<sub>6</sub>H<sub>5</sub> and NHC<sub>6</sub>H<sub>4</sub>(4-CH<sub>3</sub>) moieties is 82.3 (2) $^{\circ}$ .

In the crystal structure, the molecules are linked by weak N—H···(O)P and N—H···N hydrogen bonding interactions (Table 1) into an extended chain along [010] (Fig. 2). As illustrated for phosphoramides by Toghraee *et al.* (2011) and Pourayoubi *et al.* (2011*b,c*) by examining all deposited phosphoramides in the Cambridge Structural Database (CSD, Version 5.32, May 2011 update; Allen, 2002), the N atom of the P(=O)N unit usually adopts an *sp*<sup>2</sup> character (which is reflected in the bond angles at the N atom) and usually does not act as an acceptor in hydrogen bonding interactions. Therefore, the N—H···N—P contact in the crystal packing may rather be attributed to the assembly of the molecules with respect to one another.

#### **Experimental**

To a solution of (C<sub>6</sub>H<sub>5</sub>O)(4-CH<sub>3</sub>C<sub>6</sub>H<sub>4</sub>NH)P(O)Cl (1.714 mmol) in chloroform, a solution of *tert*-butylamine (3.428 mmol) in chloroform was added at 273 K. After 5 h stirring, the solvent was removed in vacuum and the solid product was washed with distilled water. Single crystals were obtained from a mixture of CH<sub>3</sub>CN/CHCl<sub>3</sub> at room temperature.

#### **Refinement**

The investigated crystal was found to be a two-component rotational twin. The data for both components were integrated using SAINT and scaled with TWINABS. Final refinement was done using a HKLF5 file generated by TWINABS with an appropriate BASF parameter (0.23089 (10)). The three methyl groups of the *tert*-butyl moiety were refined as being disordered in a 0.5:0.5 ratio. All H atoms were placed geometrically using a riding model. Their positions were constrained relative to their parent atom using the appropriate HFIX command in SHEXL97 (d(C—H) = 0.98 Å for methyl H atoms, d(C—H) = 0.95 Å for aromatic H atoms and d(N—H) = 0.88 Å for amide H atoms, with U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C,N) for aromatic and amide H atoms and U<sub>iso</sub>(H) = 1.5U<sub>eq</sub>(C) for methyl H atoms).

### Crystal data

C <sub>17</sub> H <sub>23</sub> N <sub>2</sub> O <sub>2</sub> P	F(000) = 680
M <sub>r</sub> = 318.34	D <sub>x</sub> = 1.274 Mg m <sup>-3</sup>
Monoclinic, P2 <sub>1</sub> /n	Mo K $\alpha$ radiation, $\lambda$ = 0.71073 Å
Hall symbol: -P 2yn	Cell parameters from 2700 reflections
$a$ = 11.412 (5) Å	$\theta$ = 2.5–27.3°
$b$ = 9.519 (4) Å	$\mu$ = 0.18 mm <sup>-1</sup>
$c$ = 15.768 (6) Å	T = 100 K
$\beta$ = 104.332 (5)°	Block, colourless
$V$ = 1659.5 (12) Å <sup>3</sup>	0.20 × 0.18 × 0.15 mm
Z = 4	

### Data collection

Bruker APEX CCD diffractometer	18075 independent reflections
Radiation source: fine-focus sealed tube graphite	2497 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.087$
Absorption correction: multi-scan (TWINABS; Sheldrick, 2008a)	$\theta_{\max} = 28.3^\circ$ , $\theta_{\min} = 2.0^\circ$
$T_{\min} = 0.966$ , $T_{\max} = 0.974$	$h = -15 \rightarrow 14$
3860 measured reflections	$k = 0 \rightarrow 12$
	$l = 0 \rightarrow 20$

## *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.089$	H-atom parameters constrained
$wR(F^2) = 0.203$	$w = 1/[\sigma^2(F_o^2) + (0.032P)^2 + 5.6384P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{\max} < 0.001$
3860 reflections	$\Delta\rho_{\max} = 0.36 \text{ e \AA}^{-3}$
235 parameters	$\Delta\rho_{\min} = -0.42 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008b), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0051 (8)

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
