Received 25 October 2011; accepted 28 October 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.036;  $wR$  factor = 0.102; data-to-parameter ratio = 21.1.

In the title compound,  $\text{C}_{24}\text{H}_{24}\text{Cl}_4\text{N}_2\text{O}_4\text{S}_2$ , the dihedral angles between the central benzene ring and the pendant rings are 58.09 (10) and 62.59 (10) $^\circ$ . The dihedral angle between the pendant rings is 81.64 (9) $^\circ$ . Both sulfonamide groups lie to the same side of the central ring but the  $\text{C}-\text{S}-\text{N}-\text{C}$  torsion angles [73.09 (16) and -117.35 (14)] and  $\text{S}-\text{N}-\text{C}-\text{C}$  torsion angles [-143.80 (14) and -111.45 (16) $^\circ$ ] differ significantly for the two pendant chains. The N atoms are close to planar (bond angle sums = 356.4 and 359.5 $^\circ$ ). In the crystal, weak  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{Cl}$  interactions link the molecules.

### **Comment**

As part of our ongoing studies of symmetrical aryl sulfonamides (Ejaz *et al.*, 2011*a,b*), the synthesis and structure of the title compound are described herein.

In the title compound (Fig. 1), the dihedral angles between the central (C1-C6) benzene ring and the pendant (C10-C15) and (C19-C24) rings are 58.09 (1) and 62.59 (10) $^{\circ}$ , respectively. The equivalent angle between the pendant rings is 81.64 (9) $^{\circ}$ . Both sulfonamide groups lie to the same side of the central ring, but the C10—S1—N1—C7 and C19—S2—N2—C16 torsion angles [73.09 (16) and -117.35 (14) $^{\circ}$ , respectively] and the S1—N1—C7—C2 and S2—N2—C16—C6 torsion angles [-143.80 (14) and -111.45 (16) $^{\circ}$ , respectively] differ significantly for the two pendant chains. The conformations of the ethyl side chains are also different: the S1—N1—C8—C9 and S2—N2—C17—C18 torsion angles are -89.6 (2) and -126.57 (19) $^{\circ}$ , respectively. The nitrogen atoms are close to planar (bond angle sums = 356.4 and 359.5 $^{\circ}$  for N1 and N2, respectively), which seems to indicate a valence state close to  $sp^2$  hybridization, as also seen in a related structure (Ejaz *et al.*, 2011*a*).

In the crystal, weak C—H···O and C—H···Cl interactions link the molecules (Table 1).

### **Experimental**

A mixture of *N,N'*-(benzene-1,3-diylmethanediyl)bis(2,5-dichlorobenzenesulfonamide) (0.3 g; 0.5 mmol), sodium hydride (0.25 g; 0.9 mmol) and *N,N*-dimethylformamide (10.0 ml) was stirred in a 100-ml round bottom flask at room temperature for half an hour followed by the addition of ethyl iodide (0.15 g; 0.9 mmol). The reaction mixture was further stirred for five hours, and its completion was monitored by TLC. After completion, the contents were poured over crushed ice. The precipitated product was isolated, washed and crystallized from methanol to yield colourless block-like crystals of the title compound.

### **Refinement**

The hydrogen atoms were placed in calculated positions (C—H = 0.93–0.97 Å) and refined as riding atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{methyl C})$ . The methyl groups were allowed to rotate, but not to tip, to best fit the electron density.

### Data collection

Bruker APEXII CCD diffractometer	5380 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.020$
graphite	$\theta_{\text{max}} = 28.4^\circ$ , $\theta_{\text{min}} = 3.0^\circ$
$\omega$ scans	$h = -8 \rightarrow 10$
25271 measured reflections	$k = -14 \rightarrow 14$
6905 independent reflections	$l = -20 \rightarrow 20$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.102$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0462P)^2 + 0.4193P]$
6905 reflections	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} = 0.001$

327 parameters  $\Delta\rho_{\max} = 0.47 \text{ e } \text{\AA}^{-3}$   
 0 restraints  $\Delta\rho_{\min} = -0.38 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
