Received 15 August 2011; accepted 30 November 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.046;  $wR$  factor = 0.123; data-to-parameter ratio = 12.3.

In the title barbiturate salt (trivial name: trimethylammonium 2,4,6-trinitrophenylbarbiturate),  $\text{C}_3\text{H}_{10}\text{N}^+\cdot\text{C}_{10}\text{H}_4\text{N}_5\text{O}_9^-$ , the asymmetric unit contains two sets of anion–cation moieties. The dihedral angle between the rings in the anions are 44.0 (3) and 45.7 (3) $^\circ$ . Adjacent anions are connected into ribbons along [100] through  $R_2^2(8)$  ring motifs formed by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds involving the barbiturate rings. Attached to both sides of these ribbons via  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds are the trimethylammonium cations.  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds are also observed.

**D. Kalaivani, M. Buvaneswari and S. Rajeswari**

### **Comment**

Barbiturates are biologically active molecules (Nogradi, 1988; Gitto *et al.*, 2006). Many reported barbiturates have noticeable side effects (Hardman & Limbird, 2001; Rana *et al.*, 2007). The growing interest in preparing new barbiturates prompted the present work. A barbiturate previously synthesized in our laboratory from 1-chloro-2,4-dinitrobenzene, barbituric acid and triethylamine has only one anion-cation pair in the asymmetric unit (Kalaivani *et al.*, 2008; Kalaivani & Malarvizhi, 2009). However, the asymmetric unit of the title barbiturate (Scheme), prepared from 1-chloro-2,4,6-trinitrobenzene, barbituric acid and trimethylamine, comprises two sets of anion-cation moieties (Fig. 1). Two sets of  $R_2^2(8)$  hydrogen bond motifs are noticed between the adjacent anions. The hydrogen bonds N9—H9···O8 and N5—H5···O16 form the first set of  $R_2^2(8)$  motif and the hydrogen bonds N10—H10···O7 and N4—H4···O17 form the second set of  $R_2^2(8)$  motif. The aggregations of these motifs form an infinite one dimensional anionic ribbon extending along [100] direction. To either side of the anionic ribbon the trimethylammonium cations are hydrogen bonded through N11—H11A···O9 and N12—H12A···O18 hydrogen bonds in the terminal positions as depicted in Fig. 2. Furthermore a number of weak C—H···O interactions (cf. Table 1) contribute to the three-dimensional coherence of the crystal structure.

### **Experimental**

1-Chloro-2,4,6-trinitrobenzene (2.5 g, 0.01 mol) in 20 ml of absolute ethanol was mixed with barbituric acid (1.3 g, 0.01 mol) in 30 ml of absolute ethanol and heated to 40°C. Trimethylamine (3 ml ~0.05 mol) was then added and the mixture was shaken well for 2 hrs. Dark maroon red crystals obtained were filtered. The filtered crystals were powdered well and washed with 50 ml of dry ether and recrystallized from absolute ethanol (yield 80%; m.p. 245 °C). Good quality crystals, suitable for single-crystal X-ray studies were obtained by slow evaporation of the ethanolic solution of title compound at room temperature.

### **Refinement**

The six N-bound H atoms were located in a difference map and were freely refined without constraints. The C-bound hydrogen atoms were placed in calculated positions ( $C—H = 0.93\text{--}0.96 \text{ \AA}$ ) and refined as riding atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for non-methyl and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for methyl H.

### Data collection

Bruker Kappa APEX II CCD diffractometer

6580 independent reflections

Radiation source: fine-focus sealed tube graphite

4977 reflections with  $I > 2\sigma(I)$

$\omega$  and  $\varphi$  scan

$R_{\text{int}} = 0.030$

Absorption correction: multi-scan (*SADABS*; Bruker, 2004)

$\theta_{\text{max}} = 26.0^\circ, \theta_{\text{min}} = 2.2^\circ$

$T_{\text{min}} = 0.90, T_{\text{max}} = 0.97$

$h = -14 \rightarrow 14$

31796 measured reflections

$k = -37 \rightarrow 37$

$l = -11 \rightarrow 11$

### Refinement

Refinement on  $F^2$

Secondary atom site location: difference Fourier map

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.046$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.123$	$w = 1/[\sigma^2(F_o^2) + (0.0538P)^2 + 1.671P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\max} < 0.001$
6580 reflections	$\Delta\rho_{\max} = 0.34 \text{ e \AA}^{-3}$
536 parameters	$\Delta\rho_{\min} = -0.30 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0021 (4)

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
