Received 17 December 2011; accepted 18 December 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C-C}) = 0.002\text{ \AA}$; R factor = 0.046; wR factor = 0.137; data-to-parameter ratio = 20.1.

In the title compound, $\text{C}_{23}\text{H}_{24}\text{N}_4\text{O}_3\cdot\text{H}_2\text{O}$, the 1,3-oxazoline ring is nearly planar [maximum deviation = 0.059 (2) \AA] and its mean plane is twisted by 30.12 (8) $^\circ$ with respect to the quinoxaline fused-ring system; the benzene ring is nearly coplanar with the quinoxaline fused-ring system [dihedral angle = 2.52 (2) $^\circ$]. The water molecule of crystallization is hydrogen-bond donor to an N atom of the quinoxaline ring system as well as an O atom of the oxazolinone unit, the two hydrogen bonds generating a chain running along the c axis.

3-{2-[{3-[(E)-2-[4-(Dimethylamino)phenyl]ethenyl}quinoxalin-2-yl]oxy}ethyl}-1,3-oxazolidin-2-one monohydrate

Y. Ramli, H. Zouihri, E. M. Essassi and S. W. Ng

Comment

2-Chloro-3-(4-dimethylaminostyryl)quinoxaline is a reactant for the synthesis of quinoxaline derivatives that possess anti-cancer properties (Noolvi *et al.*, 2011); the chloro substituent is exchanged for other organic radicals. We have used the 3-(4-dimethylaminostyryl)quinoxaline as reactant to furnish the title derivative (Scheme I). The quinoxaline fused-ring and the phenylene ring are nearly co-planar (dihedral angle 2.52 (2) $^{\circ}$) (Fig. 1). The water molecule is hydrogen bond donor to an N atom of the fused-ring as well as an O atom of the oxazolinone unit, the two hydrogen bonds generating a linear chain running along the *c*-axis of the monoclinic unit cell (Table 1).

Experimental

To 3-(4-dimethylaminostyryl)quinoxaline (1 g, 3.43 mmol), potassium carbonate (0.71 g, 5.15 mmol) and a catalytic amount of tetra-*n*-butylammonium bromide in DMF (40 ml) was added bis(2-chloroethyl)amine hydrochloride (1.22 g, 6.87 mmol). The mixture was heated for 48 hours. After the completion of the reaction (as monitored by TLC), the inorganic material salt was filtered and the solvent was removed under reduced pressure. The solid product was purified by recrystallization from ethanol to afford colorless crystals.

Refinement

Carbon-bound H-atoms were placed in calculated positions (C–H 0.93–0.97 Å) and were included in the refinement in the riding model approximation, with *U*(H) set to 1.2–1.5*U*(C).

The water H-atoms were located in a difference Fourier map and were refined with a distance restraint of O–H 0.84±0.01 Å; their temperature factors were refined.

Omitted were 0 1 1 and 0 2 0.

Figures

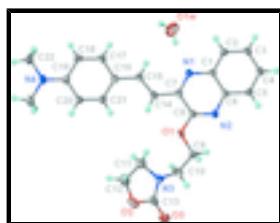

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of C₂₃H₂₄N₄O₃·H₂O at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.137$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0694P)^2 + 0.5463P]$
5836 reflections	where $P = (F_o^2 + 2F_c^2)/3$
290 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
2 restraints	$\Delta\rho_{\text{max}} = 0.48 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.25 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
