Received 9 January 2012; accepted 12 January 2012

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.033; wR factor = 0.086; data-to-parameter ratio = 16.6.

In the title compound, $(\text{C}_5\text{H}_7\text{N}_2)[\text{Fe}(\text{C}_7\text{H}_3\text{NO}_4)_2]$ or [2-apyH] $[\text{Fe}(\text{pydc})_2]$, the asymmetric unit contains an $[\text{Fe}(\text{pydc})_2]^-$ (pydc is pyridine-2,6-dicarboxylate) anion and a protonated 2-aminopyridine cation ($[\text{2-apyH}]^+$). The complex anion contains an Fe^{III} atom within a distorted octahedral FeN_2O_4 coordination geometry. N—H \cdots O and C—H \cdots O hydrogen bonding, offset π — π stacking [centroid–centroid distance = 3.805 (13) \AA] and C=O \cdots π interactions [3.494 (14) \AA] generate a three-dimensional network structure.

2-Aminopyridinium bis(pyridine-2,6-dicarboxylato)ferrate(III)

M. Mirzaei, H. Eshtiagh-Hosseini and J. T. Mague

Comment

For the synthesis of supramolecular systems, coordinative covalent bonds and weak intermolecular forces are important to the assembly into extended organized networks (Steiner, 2002). Our research group has worked on the synthesis of supramolecular systems including proton transfer compounds and their complexes and are exploring the role of non-covalent interactions such as hydrogen bonding, ion pairing and π - π stacking in constructing the supramolecular crystalline compounds and their metal complexes (Mirzaei *et al.*, 2011; Eshtiagh-Hosseini *et al.*, 2011, Eshtiagh-Hosseini, *et al.*, 2010).

The asymmetric unit of the title compound (I) is shown in Fig. 1. The Fe atom is hexa-coordinated by two N and four O atoms from two (pydc)²⁻ ions resulting in a distorted octahedral coordination environment. Although it would be reasonable to consider O1, O3, O5, and O7 as the equatorial "plane" and the N1 and N2 atoms to occupy the apical positions, the geometric constraints of the pydc^{2-} ligand generate a considerable tetrahedral distortion of this "plane" as seen from the angles O1–Fe1–O3 and O5–Fe1–O7 which are, respectively 150.46 (5) $^\circ$ and 151.47 (5) $^\circ$. Although the O1–Fe1–O3 and O5–Fe1–O7 planes are close to being orthogonal (dihedral angle = 88.49 (7) $^\circ$), the remainder of the ligands are noticeably less so. In particular, the ligand containing N1 is folded along the O1···O3 line by 30.4 (1) $^\circ$ which is likely caused by a close contact with the carbonyl group containing O8 in the anion at 1 + x , y , z . This distortion is the largest of all those found in the related complexes [Cat][Fe(py-2,6-dc)₂] (Cat = (H₅O₂) (Hseu *et al.*, 1991, Marsh *et al.*, 1993), 2,9-dimethyl-1,10-phenanthrolinium (Aghabozorg, Sadrkhanlou *et al.*, 2007), piperazinium (Aghabozorg, Nemati *et al.*, 2007), 4,4'-bipyridinium (Soleimannejad *et al.*, 2010), 2-aminopyrimidinium (Eshtiagh-Hosseini *et al.*, 2011)).

The solid state architecture of I is generated *via* intermolecular N–H···O and C–H···O hydrogen bonding (Table 1 and Fig. 2) having the graph-set motifs R_4^4 (24) and R_2^1 (6) as well as offset π – π stacking interactions between the pyridine unit containing N2 and the cation at 1 - x , - y , 1 - z (centroid-centroid distance = 3.805 (13) Å) and a C14=O8··· π interaction with the centroid of the pyridine ring containing N1 (3.494 (14) Å).

Experimental

A solution of 2-aminopyridine (0.06 g, 0.60 mmol) and pyridine-2,6-dicarboxylic acid (0.05 g, 0.30 mmol) was refluxed for 1 h. Then a solution of $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ (0.04 g, 0.15 mmol) was added dropwise and the refluxing continued for 6 hrs at 60°C. The resulting solution was light green in colour. After slow evaporation of solvent at laboratory temperature plate-like yellow crystals were collected.

Refinement

The N-bound H atoms were located in a difference Fourier map and refined freely. The C-bound H-atoms were placed in calculated positions and treated as riding atoms, with C–H = 0.95 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

	$l = -40 \rightarrow 40$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.033$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.086$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0387P)^2 + 2.8224P]$
5007 reflections	where $P = (F_o^2 + 2F_c^2)/3$
301 parameters	$(\Delta/\sigma)_{\max} = 0.002$
0 restraints	$\Delta\rho_{\max} = 0.47 \text{ e \AA}^{-3}$
	$\Delta\rho_{\min} = -0.38 \text{ e \AA}^{-3}$

Special details

Experimental. The diffraction data were obtained from 3 sets of 400 frames, each of width 0.5 °. in omega, collected at phi = 0.00, 90.00 and 180.00 °. and 2 sets of 800 frames, each of width 0.45 ° in phi, collected at omega = -30.00 and 210.00 °. The scan time was 10 sec/frame.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger. H-atoms attached to carbon were placed in calculated positions ($C-H = 0.95 \text{ \AA}$) and included as riding contributions with isotropic displacement parameters 1.2 times those of the attached atoms. Those attached to nitrogen were independently refined.
