Received 14 December 2011; accepted 20 December 2011

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.055;  $wR$  factor = 0.148; data-to-parameter ratio = 16.6.

In the title compound,  $\text{C}_{23}\text{H}_{25}\text{N}_3\text{O}_3$ , the benzimidazole ring system is essentially planar [maximum deviation = 0.0240 (18)  $\text{\AA}$ ]. The mean plane through this ring system forms a dihedral angle of 42.23 (7) $^\circ$  with the benzene ring. The pyrrolidine ring is in an envelope conformation with the flap atom disordered over two sites with occupancies of 0.813 (11) and 0.187 (11). In the crystal, weak  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds form  $R_2^2(10)$  ring motifs, which are connected by further  $\text{C}-\text{H}\cdots\text{O}$  interactions, forming ribbons along the  $b$  axis. The crystal structure is further stabilized by weak  $\pi-\pi$  interactions involving the imidazole and benzene rings of the benzimidazole ring system [centroid–centroid distances = 3.6788 (11) and 3.6316 (10)  $\text{\AA}$ ] and weak  $\text{C}-\text{H}\cdots\pi$  interactions.

### Comment

Benzimidazoles are a class of bioactive heterocyclic compounds which exhibit a wide range of activities such as antibacterial (Ozden *et al.*, 2008), antiproliferatives (Garuti *et al.*, 2000), anti-HIV (Rao *et al.*, 2002) and anti-inflammatory (Thakurdesai *et al.*, 2007). In view of their importance, the crystal structure determination of the title compound was carried out and the results are presented here.

In the title molecule, Fig. 1, the benzimidazole, (N1–N2/C1–C7) ring is essentially planar with maximum deviation of 0.0240 (18) Å for atom C5. The mean plane through this ring makes a dihedral angle of 42.23 (7)° with the benzene, (C8–C13) ring. Atom C21 is disordered (Fig. 1) over two positions, with occupancy ratios of 0.813 (11):0.187 (11). The disordered pyrrolidine ring adopts an envelope conformation with puckering parameters  $Q = 0.2836 \text{ \AA}$ ,  $\phi = 249.7429^\circ$  with C21 at the flap and  $Q = 0.2163 \text{ \AA}$ ,  $\phi = 77.1714^\circ$  with C21X at the flap (Cremer & Pople, 1975).

In the crystal packing (Fig. 2),  $R^2_{2(10)}$  ring motifs (Bernstein *et al.*, 1995) are formed by C19—H19B···O3(1-x,-1-y,1-z) intermolecular interactions. C5—H5A···O3(1-x,-1-y,1-z) and C16—H16B···O3 (1-x,-y,1-z) interactions further link the molecules into ribbon along the *b* axis.  $\pi$ – $\pi$  stacking interactions are observed within the benzimidazole ring system between the imadazole (N1–N2/C1/C6–C7); centroid *Cg*1 and the benzene (C1–C6; centroid *Cg*2) rings with a *Cg*1···*Cg*2 (1-x,-y,1-z) distance of 3.6788 (11) and between the benzene rings with a *Cg*2···*Cg*2(1-x,-y,1-z) distance of 3.6316 (10). The crystal packing is further stabilized by weak C—H··· $\pi$  interactions (Table 1).

### Experimental

Ethyl 3-amino-4-(3(2-oxopyrrolidin-1-yl)propylamino)benzoate (0.84 mmol) and sodium metabisulfite adduct of benzaldehyde (1.68 mmol) were dissolved in DMF. The reaction mixture was reflux at 130 °C for 2 hrs. After completion, the reaction mixture was diluted in Ethyl acetate (20 mL) and washed with water (20 mL). The organic layer was collected, dried over Na<sub>2</sub>SO<sub>4</sub> and the evaporated in vacuo to yield the product. The product was recrystallised from Ethyl acetate.

### Refinement

All H atoms positioned geometrically and refined using a riding model with C–H = 0.95–0.99 Å. The *U*<sub>iso</sub> values were constrained to be 1.5*U*<sub>eq</sub> (methyl-H atom) and 1.2*U*<sub>eq</sub> (other H atoms). The rotating model group was applied for the methyl group.

$T_{\text{min}} = 0.967, T_{\text{max}} = 0.979$	$h = -12 \rightarrow 12$
17976 measured reflections	$k = -13 \rightarrow 13$
	$l = -14 \rightarrow 14$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.055$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.148$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0797P)^2 + 0.518P]$ where $P = (F_o^2 + 2F_c^2)/3$
4530 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
273 parameters	$\Delta\rho_{\text{max}} = 0.48 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.29 \text{ e \AA}^{-3}$

### Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
