Received 12 December 2011; accepted 22 December 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.054; wR factor = 0.145; data-to-parameter ratio = 15.6.

There are two independent molecules in the asymmetric unit of the title compound, $C_{20}H_{17}\text{ClO}_3$, each having an *E* configuration about the $-\text{C}=\text{C}-$ bond. The dihedral angles between the two benzene rings in the two molecules are 7.17 (11) and 9.82 (11) $^\circ$. In both molecules, the hydroxy group is involved in an intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bond.

(E)-3-(4-Chlorophenyl)-1-(5-hydroxy-2,2-dimethyl-2H-chromen-6-yl)prop-2-en-1-one

J. Tang, J. Chen and L. Jiang

Comment

Chalcones (1,3-diaryl-2-propen-1-ones) are structurally simple compounds of the flavonoid family which display an impressive array of biological properties such as anticancer (Rao *et al.*, 2004; Tran *et al.*, 2009), antileishmanial (Boeck *et al.*, 2006), antifungal activity (Opletalova & Sedivy, 1999) and antioxidant activity (Dimmock *et al.*, 1999). Chalcones can be easily obtained from the adol condensation of aromatic aldehydes and aromatic ketones. The crystal structure of related compounds: (E)-1-(5-Hydroxy-2,2-dimethyl-2H-chromen-6-yl)-3-(3,4,5-trimethoxyphenyl)prop-2-en-1-one (Wang *et al.*, 2011) and (2E)-1-(2-Bromophenyl)-3-(3,4,5-trimethoxyphenyl)prop-2-en-1-one (Jasinski *et al.*, 2009) have been reported recently. The crystal structure of the title compound (I) is reported in this paper.

The asymmetric unit of (I) consists of two crystallographically independent molecules (Fig. 1). The bond distances are normal and are comparable with a closely related structure (Wang *et al.*, 2011). Each molecule of (I) exists in an E configuration with respect to the C7=C8 double bond. The dihedral angles between the two benzene rings in each molecule are 7.17 (11) $^{\circ}$ [C21—C26/C30—C35] and 9.82 (11) $^{\circ}$ [C1—C6/C10—C15]. In both independent molecules, the hydroxy group is involved in an intramolecular O—H \cdots O hydrogen bond.

Experimental

1-(5-hydroxy-2,2-dimethyl-2H-chromen-6-yl)ethanone (2.182 g, 10 mmol), 4-chlorobenzaldehyde (1.962 g, 10 mmol) in ethanal KOH (20% *w/v* aqueous solution) and the mixture was stirred at 273 K for 10 h. The crude product was recrystallized from ethanol to give (I). Single crystals suitable for X-ray structure determination were grown by slow evaporation of a diethyl ether solution of (I) at room temperature.

Refinement

H atoms were positioned geometrically (C—H = 0.93–0.96 Å, O—H = 0.86 Å) and constrained to ride on their parent atoms in a riding-model approximation, with $U_{iso}(\text{H}) = 1.2eq(\text{C})$ or $1.5U_{eq}(\text{Cmethyl}, \text{O})$.

Figures

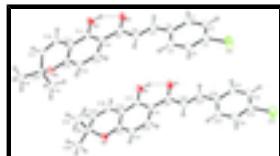

Fig. 1. The two independent molecules of (I) with 30% probability displacement ellipsoid. Dashed lines denote intermolecular hydrogen bonds.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.054$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.145$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0503P)^2 + 0.9761P]$
6836 reflections	where $P = (F_o^2 + 2F_c^2)/3$
439 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.17 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.32 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
