Received 19 December 2011; accepted 27 December 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.043; wR factor = 0.110; data-to-parameter ratio = 14.0.

In the title compound, $\text{C}_{13}\text{H}_{10}\text{N}_2\text{O}_5\text{S}$, the N–C bond in the C–SO₂–NH–C segment has *gauche* torsion angles with respect to the S=O bonds. The conformation between the N–H bond and the *ortho*-nitro group in the sulfonyl benzene ring is *syn*. The molecule is twisted at the S–N bond with a torsion angle of $-63.4(2)^\circ$. The sulfonyl benzene ring is tilted by $77.1(1)^\circ$ relative to the –SO₂–NH–C–O segment. The dihedral angle between the sulfonyl and the benzoyl benzene rings is $88.6(1)^\circ$. In the crystal, pairs of N–H···O(S) hydrogen bonds link the molecules into inversion dimers, which are linked by weak C–H···O and C–H···π interactions along the *b* axis.

N-Benzoyl-2-nitrobenzenesulfonamide

P. A. Suchetan, S. Foro, B. T. Gowda and B. Nirmala

Comment

Diaryl acylsulfonamides are known as potent antitumor agents against a broad spectrum of human tumor xenografts in nude mice. As part of our studies on the substituent effects on the structures and other aspects of *N*-(aryl)-amides (Bowes *et al.*, 2003; Gowda *et al.*, 2006), *N*-(aryl)-methanesulfonamides (Jayalakshmi & Gowda, 2004), *N*-(aryl)-arylsulfonamides (Gowda *et al.*, 2003); *N*-(substitutedbenzoyl)-arylsulfonamides (Suchetan *et al.*, 2010) and *N*-chloro-arylsulfonamides (Gowda & Mahadevappa, 1983), in the present work, the crystal structure of *N*-(benzoyl)- 2-nitrobenzenesulfonamide (I) has been determined (Fig.1).

In (I), the conformation between the N—H and C=O bonds in the C—SO₂—NH—C(O) segment is *anti* (Fig.1), similar to that observed in *N*-(benzoyl)-2-methylbenzenesulfonamide (II) (Suchetan *et al.*, 2010). Furthermore, the N—C bond in the segment has *gauche* torsion with respect to the S=O bonds, while, the conformation between the N—H bond and the *ortho*-nitro group in the sulfonyl benzene ring is *syn*.

The molecule is twisted at the S—N bond with the torsional angle of -63.39 (22) $^{\circ}$, compared to the value of 68.8 (4) $^{\circ}$ in (II).

The dihedral angle between the sulfonyl benzene ring and the —SO₂—NH—C—O segment is 77.1 (1) $^{\circ}$, compared to the value of 84.8 (1) $^{\circ}$ in (II). Further, the dihedral angle between the sulfonyl and the benzoyl benzene rings is 88.6 (1) $^{\circ}$, compared to the value of 73.9 (1) $^{\circ}$ in (II).

In the crystal, intermolecular N1—H1N···O2 and C13—H13···O2 hydrogen bonds link the molecules as dimers and these dimers are also linked by C11—H11···O3 hydrogen bonds and C—H··· π interactions along b-axis (Table 1). [C6—H6···Cg1, cg1 is the centroid of C8—C13 ring] Parts of the crystal structure are shown in Fig. 2., Fig. 3. and Fig. 4.

Experimental

The title compound was prepared by refluxing a mixture of benzoic acid (0.02 mole), 2-nitrobenzenesulfonamide (0.02 mole) and excess phosphorous oxy chloride for 3 h on a water bath. The resultant mixture was cooled and poured into crushed ice. The solid, *N*-(benzoyl)-2-nitrobenzenesulfonamide, obtained was filtered, washed thoroughly with water and then dissolved in sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. It was filtered, dried and recrystallized.

Prism like colourless single crystals of the title compound used in X-ray diffraction studies were obtained by slow evaporation of its toluene solution at room temperature.

supplementary materials

Refinement

The H atom of the NH group was located in a difference map and later restrained to N—H = 0.86 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

Figures

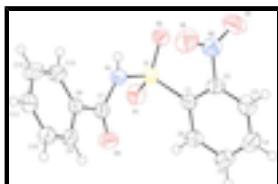

Fig. 1. Molecular structure of the title compound, showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level.

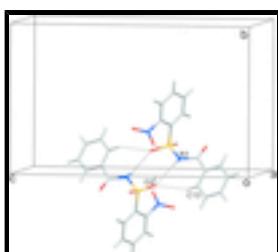

Fig. 2. Part of the crystal structure of the title compound, showing the dimers formed by N—H..O and C-H..O hydrogen bonds. [Symmetry code: (i) 2-x, -y, 1-z]

Fig. 3. Part of the crystal structure of the title compound, showing the linking of the dimers by C-H..O hydrogen bonds along to the [010] direction. For the sake of clarity, H atoms not involved in the motif shown have been omitted. [Symmetry code: (ii) = 5/2-x, y-1/2, z]

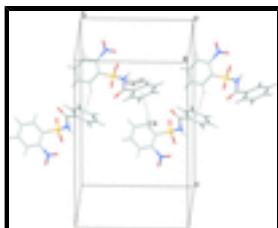

Fig. 4. Part of the crystal structure of the title compound, showing the formation of a chain along [010] generated by the C-H.. π interactions. [Symmetry code: (iii) = 2-x, y+1/2, -z+1/2]

Data collection

Oxford Diffraction Xcalibur diffractometer with a Sapphire CCD detector	2711 independent reflections
Radiation source: fine-focus sealed tube graphite	2010 reflections with $I > 2\sigma(I)$
Rotation method data acquisition using ω scans	$R_{\text{int}} = 0.020$
Absorption correction: multi-scan (<i>CrysAlis RED</i> ; Oxford Diffraction, 2009)	$\theta_{\text{max}} = 26.4^\circ, \theta_{\text{min}} = 2.7^\circ$
$T_{\text{min}} = 0.883, T_{\text{max}} = 0.901$	$h = -13 \rightarrow 15$
6396 measured reflections	$k = -14 \rightarrow 14$
	$l = -14 \rightarrow 23$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.043$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.110$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0388P)^2 + 2.8009P]$
2711 reflections	where $P = (F_o^2 + 2F_c^2)/3$
193 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
1 restraint	$\Delta\rho_{\text{max}} = 0.31 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.36 \text{ e \AA}^{-3}$

Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 is the centroid of the C8—C13 ring.

$D—\text{H}\cdots A$	$D—\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D—\text{H}\cdots A$
N1—H1N···O2 ⁱ	0.84 (2)	2.21 (2)	3.003 (3)	158 (2)
C11—H11···O3 ⁱⁱ	0.93	2.51	3.267 (3)	139.
C13—H13···O2 ⁱ	0.93	2.53	3.313 (3)	142.
C6—H6···Cg1 ⁱⁱⁱ	0.93	2.82	3.678 (13)	153.

Symmetry codes: (i) $-x+2, -y, -z+1$; (ii) $-x+5/2, y-1/2, z$; (iii) $-x+2, y+1/2, -z+1/2$.
