

4-Methoxy-3-(trifluoromethyl)aniline**Jian-Ling He**

College of Chemical and Biological Engineering, Yancheng Institute of Technology, Yinbing Road No. 9 Yancheng, Yancheng 224051, People's Republic of China
Correspondence e-mail: jlheyc@163.com

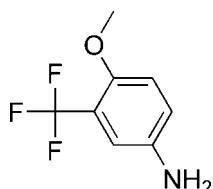

Received 21 December 2011; accepted 4 January 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$;
 R factor = 0.059; wR factor = 0.162; data-to-parameter ratio = 14.6.

In title compound, $\text{C}_8\text{H}_8\text{F}_3\text{NO}$, the methoxy group is inclined at $8.7(4)^\circ$ to the benzene ring plane. The crystal structure is stabilized by intermolecular $\text{N}-\text{H}\cdots\text{F}$, $\text{N}-\text{H}\cdots\text{N}$ and $\text{C}-\text{H}\cdots\text{F}$ hydrogen-bonding interactions.

Related literature

The title compound is an intermediate in the synthesis of trifluoromethyl-containing phthalic acid diamides, which are effective pesticides. For the preparation, see: Feng & Li (2010). For the crystal structure of a closely related compound, see: Crampton *et al.* (2006).

4-Methoxy-3-(trifluoromethyl)aniline

J.-L. He

Comment

The title compound (Fig. 1) is used as an important intermediate in the synthesis of trifluoromethyl-containing phthalic acid compounds which are recognized as effective pesticides (Feng & Li, 2010). In the title molecule, the N, O and C8 atoms bonded to the central benzene ring (C2–C7) lie in its plane with methoxy group (O/C1) oriented at 8.7 (4) ° with respect to the benzene ring plane. There is an intramolecular interaction C6—H6A···F3 which stabilizes the molecular structure of the title compound. The crystal structure is stabilized by N—H0A···F1, N—H0B···N and C1—H1C···F2 intermolecular hydrogen bonding interactions. The bond distances and bond angles in the title compound agree with the corresponding bond distances and bond angles reported in a closely related compound (Crampton *et al.*, 2006).

Experimental

The title compound was prepared by a method reported in the literature (Feng & Li, 2010)). A solution of 4-amino-2-(trifluoromethyl)phenol (2 g, 11.3 mmol) in dichloromethane (20 ml) was added slowly to a solution of sodium hydride (0.33 g, 13.6 nmol) in an ice bath. After stirring for 6 h iodomethane (4.8 g, 33.9 mmol) was added slowly in 1 h. After stirring for 48 h at room tempeature, the solvent was evaporated on a rotary evaporator yielding the title compound. Colorless blocks of the title compound were grown in ethanol (20 ml) by slow evaporation of the solvent at room temperature in about 7 days.

Refinement

The H atoms were positioned geometrically and constrained to ride on their parent atoms, with N—H = 0.86 Å and C—H = 0.93 and 0.96 Å for aryl and alky H-atoms, respectively, with $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C}/\text{N})$, where $x = 1.2$ for aromatic and amino H, and $x = 1.5$ for aryl H atoms.

Figures

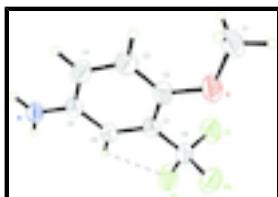

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.059$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.162$	H-atom parameters constrained
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.074P)^2 + 0.3348P]$
1722 reflections	where $P = (F_o^2 + 2F_c^2)/3$
118 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.20 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.19 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
