Received 10 January 2012; accepted 13 January 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.044; wR factor = 0.124; data-to-parameter ratio = 14.5.

In the title compound, $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_5\text{S}$, the conformation between the N–H group and the *ortho*-nitro group in the sulfonyl benzene ring is *syn* and that between the C=O and *meta*-methyl groups in the benzoyl ring is *anti*. The molecule is twisted at the S–N bond with a torsion angle of $64.3(2)^\circ$. The dihedral angle between the sulfonyl benzene ring and the $-\text{SO}_2-\text{NH}-\text{C}-\text{O}$ segment is $75.73(7)^\circ$ and that between the sulfonyl and benzoyl benzene rings is $89.5(1)^\circ$. The crystal structure features inversion-related dimers linked by pairs of N–H···O(S) hydrogen bonds.

N-(3-Methylbenzoyl)-2-nitrobenzenesulfonamide

P. A. Suchetan, S. Foro and B. T. Gowda

Comment

Diaryl acylsulfonamides are known as potent antitumor agents. As part of our studies on the substituent effects on the structures and other aspects of *N*-(aryl)-amides (Bowes *et al.*, 2003; Gowda *et al.*, 1999, 2003), *N*-(aryl)-methanesulfonamides (Gowda *et al.*, 2007), *N*-(aryl)-arylsulfonamides (Shetty & Gowda, 2005); *N*-(substitutedbenzoyl)-arylsulfonamides (Suchetan *et al.*, 2012); *N*-chloroarylsulfonamides (Jyothi & Gowda, 2004) and *N*-bromoarylsulfonamides (Usha & Gowda, 2006), in the present work, the crystal structure of *N*-(3-methylbenzoyl)-2-nitrobenzenesulfonamide (I) has been determined (Fig.1).

The conformation between the N—H and C=O bonds in the C—SO₂—NH—C(O) segment is *anti* and the N—C bond in the segment has *gauche* torsion with respect to the S=O bonds (Fig.1), similar to that observed in *N*-(2-chlorobenzoyl)-2-nitrobenzenesulfonamide (II)(Suchetan *et al.*, 2012). In (I), the conformation between the N—H bond and the *ortho*-nitro group in the sulfonyl benzene ring is *syn*, similar to that observed in (II). Further, the conformation of the C=O is *anti* to the *meta*-methyl group in the benzoyl ring, similar to that observed between the C=O and the *ortho*-Cl atom in (II).

The molecule is twisted at the S—N bond with the torsional angle of 64.32 (20) $^{\circ}$, compared to the value of -59.68 (17) $^{\circ}$ in (II).

The dihedral angle between the sulfonyl benzene ring and the —SO₂—NH—C—O segment is 75.7 (1) $^{\circ}$, compared to the value of 77.5 (1) $^{\circ}$ in (II). Furthermore, the dihedral angle between the sulfonyl and the benzoyl benzene rings is 89.5 (1) $^{\circ}$, compared to the value of 71.2 (1) $^{\circ}$ in (II).

In the crystal, the intermolecular N—H \cdots O (S) hydrogen bonds (Table 1) link the molecules into dimeric chains. Part of the crystal structure is shown in Fig. 2.

Experimental

The title compound was prepared by refluxing a mixture of *m*-methylbenzoic acid (0.02 mole), 2-nitrobenzenesulfonamide (0.02 mole) and excess phosphorous oxychloride for 3 h on a water bath. The resultant mixture was cooled and poured into crushed ice. The solid, *N*-(3-methylbenzoyl)-2-nitrobenzenesulfonamide, obtained was filtered, washed thoroughly with water and then dissolved in sodium bicarbonate solution. The compound was later reprecipitated by acidifying the filtered solution with dilute HCl. It was filtered, dried and recrystallized.

Prism like colourless single crystals of the title compound used in X-ray diffraction studies were obtained by slow evaporation of its toluene solution at room temperature.

supplementary materials

Refinement

The H atom of the NH group was located in a difference map and later restrained to N—H = 0.86 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with the aromatic C—H = 0.93 Å and the methyl C—H = 0.93 Å. All H atoms were refined with isotropic displacement parameters set at 1.2 U_{eq} (C-aromatic, N) and 1.5 U_{eq} (C-methyl).

Figures

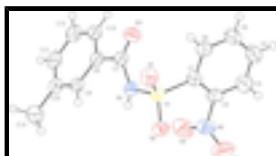

Fig. 1. Molecular structure of the title compound, showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level.

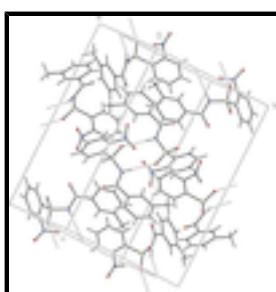

Fig. 2. Molecular packing in the title compound. Hydrogen bonds are shown as dashed lines.

 $\Delta\rho_{\max} = 0.38 \text{ e } \text{\AA}^{-3}$

1 restraint

 $\Delta\rho_{\min} = -0.33 \text{ e } \text{\AA}^{-3}$ *Special details*

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
