The asymmetric unit of the title co-crystalline 1:2 adduct, $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2\cdot 2\text{C}_6\text{H}_3\text{N}_3\text{O}_6$, contains two independent molecules of bis(4-aminophenyl) sulfone (the drug Dapsone) and four molecules of 1,3,5-trinitrobenzene and is extended into a two-dimensional hydrogen-bonded network structure through amino N–H \cdots O hydrogen-bonding associations with nitro O-atom acceptors. In the two independent Dapsone molecules, the inter-ring dihedral angles are 69.6 (3) and 63.63 (9) $^\circ$. Aromatic π – π interactions are also found between one of the Dapsone aromatic rings and a trinitrobenzene ring [minimum ring centroid separation = 3.596 (3) \AA]. A 4-aminophenyl ring moiety of one of the Dapsone molecules and two nitro groups of a trinitrobenzene are disordered in a 50:50 ratio.

4-(4-Aminophenylsulfonyl)aniline-1,3,5-trinitrobenzene (1/2)

G. Smith and U. D. Wermuth

Comment

Dapsone [4-(4-aminophenylsulfonyl)aniline] is a very weak Lewis base which finds use as an anti-leprotic, anti-malarial and leprostatic drug (Wilson *et al.*, 1991). The structure of the anhydrous parent compound is known (Dickenson *et al.*, 1970) and its partial (1/3) hydrate has been reported (Kus'mina *et al.*, 1981). However, no compounds or adducts of Dapsone are found in the crystallographic literature. Our attempted preparation of Dapsone with 2,4,6-trinitrobenzoic acid (TNBA) resulted in the title compound, the TNB adduct molecules resulting from the common facile decarboxylation of the parent acid (Smith *et al.*, 2002).

The asymmetric unit of the title adduct (Fig. 1) contains two independent molecules of Dapsone (*A* and *B*) and four molecules of 1,3,5-trinitrobenzene (TNB) (*C–F*) and is extended into a two-dimensional hydrogen-bonded network structure (Fig. 2) through amino N—H···O hydrogen-bond associations with nitro O-atom acceptors (Table 1). No interactions with sulfone O-atom acceptors are present. A weak π – π interaction is also found between one of the Dapsone aromatic ring moieties (C1*A*–C6*A*) and a TNB *F* ring [minimum ring centroid separation 3.719 (4) Å]. A 4-aminophenyl ring moiety of one of the Dapsone molecules (C1*A*–C6*A*, N4*A*) is 50% disordered, with the ring of the second component (C1*X*–C6*X*, N4*X*) giving a ring centroid separation of 3.596 (3) Å with the trinitrobenzene *A* ring. Two of the nitro groups of the *A* molecule are also 50% disordered. In the two independent Dapsone molecules the inter-ring dihedral angles are 69.6 (3) $^\circ$ (*A*) and 63.63 (9) $^\circ$ (*B*) which compare with 77.3 $^\circ$ in the anhydrous parent Dapsone molecule (Dickenson *et al.*, 1970) and 88.1, 75.8 and 74.7 $^\circ$ for the three independent Dapsone molecules in the 0.33 hydrate structure (Kus'mina *et al.*, 1981).

Experimental

The title compound was formed in an attempted synthesis of a proton-transfer salt of 4-(4-aminophenylsulfonyl)aniline (Dapsone) with 2,4,6-trinitrobenzoic acid by heating 1 mmol quantities of the two reagents in 50 ml of 50% ethanol–water for 15 min under reflux. Facile decarboxylation of the acid resulted in the formation of orange needle crystals of the title Dapsone- 1,3,5-trinitrobenzene co-crystal [m.p. 414–415 K], after room-temperature evaporation of the solvent.

Refinement

All H atoms were included at calculated positions [N—H = 0.88 Å; C—H = 0.95 Å] and treated as riding, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N/C})$. No reasonable acceptor atoms could be found for three of the H-atoms on separate amino groups (H42*A*, H42*B* and H44*B*). The atoms (C1–C6, N4) of Dapsone molecule *A* were disordered over two sites in a 50:50 ratio. Two nitro groups of the π -associated TNB *F* molecule (N11, O11, O12; N51, O51, O52) were also found to be similarly disordered in a 50:50 ratio.
