Received 15 January 2012; accepted 19 January 2012

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.067; wR factor = 0.155; data-to-parameter ratio = 20.8.

The asymmetric unit of the title Schiff base compound, $C_{21}H_{21}NO$, contains two crystallographically independent molecules. The dihedral angles between the naphthalene mean plane and the benzene ring are $29.28(8)$ and $26.92(8)^\circ$ in the two molecules. An intramolecular $\text{O}-\text{H}\cdots\text{N}$ hydrogen bond and weak intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds stabilize the structure of each independent molecule.

Comment

Since the discovery of post metallocene catalysts systems such as salicylaldimine (phenoxy-imine, FI catalysts) in late 1990's by Fujita group, there have been many researches concerning these catalysts (Matsui & Fujita, 2001; Matsui *et al.*, 2001). In general, they have found that some phenoxy-imine-based complexes of the group IV metals have very high activity, versatility and polymerization capabilities in olefin polymerization (Matsui *et al.*, 1999).

In FI catalysts, the ligand systems can be produced by using condensation reaction of salicylaldehydes and primary amines, under standard conditions. These reactions produce Schiff bases with high selectivity, in high yield. Amines and some salicylaldehyde derivatives are commercially available. The presence of salicylaldimine unit allows for easy variation of the system on both the phenol and amine functionalities, for instance the variations of the mentioned compounds lead to profound effects on polymers.

X-ray crystallographic analysis reveals that there are two molecules in the asymmetric unit of the title Schiff base compound (Fig. 1). In both molecules, the C=N bond distances are 1.289 (3) and 1.290 (3) Å, respectively. The angle between naphthalene mean plane and phenyl rings are equal to 29.28 (8) and 26.92(8)°, respectively. Bond distances and angles are in the normal ranges reported for Schiff base compounds (Hiller *et al.*, 1993; Dahrensbourg *et al.*, 2005; Jamjah *et al.*, 2011). There are intramolecular O—H···N hydrogen bonding between hydroxyl and imine groups. There are also weak intramolecular C—H···O hydrogen bonding which play important role in the stabilization of the crystal structure of the title compound (Fig. 1 & Table 1).

Experimental

Synthesis of 3-*tert*-butyl-2-hydroxybenzaldehyde

2,6-dimethylpyridine (50.0 mmol, 5.4 g) and SnCl₄ (10.0 mmol, 2.6 g) were added into 2-*tert*-butylphenol (40.0 mmol, 6 g) in toluene (125 ml) into a 250 ml round-bottom flask which had been already dried and purged with nitrogen and equipped with a stirrer bar. White fumes appeared immediately during the addition and stirring was continued at room temperature for 30 min. The mixture turned yellow, and then dry paraformaldehyde (160.0 mmol, 4.8 g) was added into the reaction solution and stirred at 100°C for 12 hrs. After cooling to room temperature, the yellow reaction mixture was poured into a mixed solution of water (3×100) and diethyl ether (3×50). The yellow precipitate was removed *via* filtration. The filtrate was extracted with diethyl ether (2×100 ml) and the organic layer was washed further with saturated NaCl(aq) (brine) (50 ml). The solution was then dried over anhydrous sodium sulfate. After that, it was concentrated under reduced pressure (in a rotary evaporator) and the residue was purified *via* column chromatography on silica gel, using a mixed solvent of ethylacetate/hexane (*v/v*, 5/100) as the mobile phase. The product was isolated as pale yellow oil and characterized by ¹H-NMR, ¹³C-NMR and FTIR as follows.

supplementary materials

¹H-NMR (400 MHz, in CDCl₃): δ (p.p.m.) 1.43 (s, 9H C(CH₃)₃), 6.95 (s, 1H, Ar—H), 7.39 (s, 1H, Ar—H), 7.53 (s, 1H, Ar—H), 9.85 (s, 1H, CHO), 11.82 (s, 1H, OH).

¹³C-NMR (400 MHz, in CDCl₃): δ (p.p.m.) 30.04 (*t*-Bu—CH₃), 35.66 (*t*-Bu—C), 120.06 (Aryl-C-5), 121.83 (Aryl-C-1), 132.81 (Aryl-C-4), 134.24 (Aryl-C-6), 162.38 (Aryl-C-2), 197.28 (CHO).

FTIR (KBr): 2958.49 (OH), 1650.66 (CHO) cm⁻¹. CHN (Calcd. (Anal): C, 74.05 (74.15); H, 7.87(7.80), (yield: 85%).

Synthesis of (*E*)-2-*tert*-butyl-6-((naphthalen-1-ylimino)methyl)phenol:

Into a 100 ml round-bottom flask which had been dried and purged with nitrogen, ethanol (30 ml), α-naphthylamine (9.99 mmol, 1.34 g), 3-*tert*-butyl-2-hydroxybenzaldehyde (7.86 mmol, 1.40 g) and molecular sieve 3Å (5 g) were added. This mixture was refluxed at 78°C for 8 hrs and then stirred at ambient temperature for another 12 hrs. The reaction solution was concentrated under reduced pressure (in a rotary evaporator). The residue was purified *via* column chromatography on silica gel, using a mixed solvent of ethylacetate/hexane (v/v, 2/98) as the mobile phase to obtain a yellow-orange crystalline solid (yield: 98%). ¹H-NMR (400 MHz, in CDCl₃): δ (p.p.m.) 1.54 (s, 9H C(CH₃)₃), 6.93–7.79 (m, 11H), 8.30–8.71 (m, 1H), 11.81(s, 1H).

Refinement

All H atoms were positioned geometrically and refined as riding atoms with O—H = 0.82, *U*_{iso}(H) = 1.5*U*_{eq}(O) and C—H = 0.93 to 0.96 Å, *U*_{iso}(H) = 1.5*U*_{eq}(C) for methyl H atoms and 1.2*U*_{eq}(C) for the others.

Figures

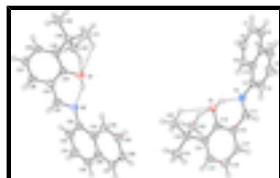

Fig. 1. The molecular structure of the title compound with displacement ellipsoids drawn at 50% probability level. The intramolecular O—H···N and C—H···O hydrogen bonds are shown as dashed lines.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.067$	H-atom parameters constrained
$wR(F^2) = 0.155$	$w = 1/[\sigma^2(F_o^2) + (0.0561P)^2 + 2.5641P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} = 0.001$
8840 reflections	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
424 parameters	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$
0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.0039 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
