Received 5 February 2012; accepted 6 March 2012

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  $R$  factor = 0.061;  $wR$  factor = 0.139; data-to-parameter ratio = 19.0.

In the title compound,  $[\text{Ni}(\text{C}_7\text{H}_4\text{N}_3\text{O}_2)_2(\text{C}_{12}\text{H}_8\text{N}_2)_2]\cdot\text{CH}_3\text{OH}$ , the  $\text{Ni}^{II}$  atom is six-coordinated in a distorted  $\text{N}_6$  octahedral geometry and is chelated by two phenanthroline ligands and two phenylcyanamide groups which occupy *cis* positions. The (4-nitrophenyl)cyanamide anions act as monodentate ligands. There is one classical intermolecular  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bond and several  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds are also observed.

## **cis-Bis[(4-nitrophenyl)cyanamido- $\kappa N^1$ ]bis(1,10-phenanthroline- $\kappa^2 N,N'$ )nickel(II) methanol monosolvate**

**Hossein Chiniforoshan, Mehdi Jazestani and Behrouz Notash**

### **Comment**

Phenylcyanamide ligands (pcyd) can act as monodentate (Letcher *et al.*, 1993; Kim *et al.*, 2002; Shen *et al.*, 1999) and also as bridging ligands (Crutchley, 2001). In the bridging mode, the cyanamido group (NCN) is coordinated in the end-to-end mode, forming polynuclear complexes (Chiniforoshan *et al.* 2009, 2010, 2012; Escuer *et al.*, 2004; Ainscough *et al.*, 1991).

Following our work with this family of ligands, we report here the synthesis and crystal structure of mononuclear  $[\text{Ni}(\text{Phen})_2(4\text{-NO}_2\text{-pcyd})_2]\text{CH}_3\text{OH}$  compound of (4-nitrophenyl)cyanamide ligand, Crutchley & Naklicki (1989). The asymmetric unit of the title compound is shown in Fig. 1. In the structure of the title compound, nickel(II) atom has a distorted octahedral geometry (Fig. 1). The coordination environment consist of four nitrogen atoms from two 1,10-phenanthroline ligand and two anionic 4-NO<sub>2</sub>-phenylcyanamide ligands which occupy *cis* position. Bond lengths and angles are in the normal ranges reported for similar structures (Wu *et al.*, 2004; Cheng *et al.*, 2002; Shen *et al.*, 1999). Crutchley (2001) has shown that the angle of a metal atom with the axial CN moiety ranges from 180° to 120°. These angles for the title compound are equal to 153.2 (2) and 150.6 (3)° for Ni(1)—N(5)—C(25) and Ni(1)—N(8)—C(32), respectively. There are several intermolecular O—H···N and C—H···O hydrogen bonds which play important role in the stabilization of crystal structure (Table 1 & Fig. 2).

### **Experimental**

A solution of Ni(OAc)<sub>2</sub>·4H<sub>2</sub>O (0.24 gr, 0.1 mmol) in 25 ml of methanol was slowly added to methanolic solution (in 35 ml) of 4-nitrophenylcyanamide (Crutchley & Naklicki, 1989) (0.32 gr, 0.2 mmol) and 1,10-phenanthroline (0.39 gr, 0.2 mmol). The mixture was stirred at ambient temperature and the yellow solid filtered after 5 h. The yellow crystals suitable for X-ray structure determination were obtained by dissolving this solid in DMF then diffused by methanol after 3 weeks.

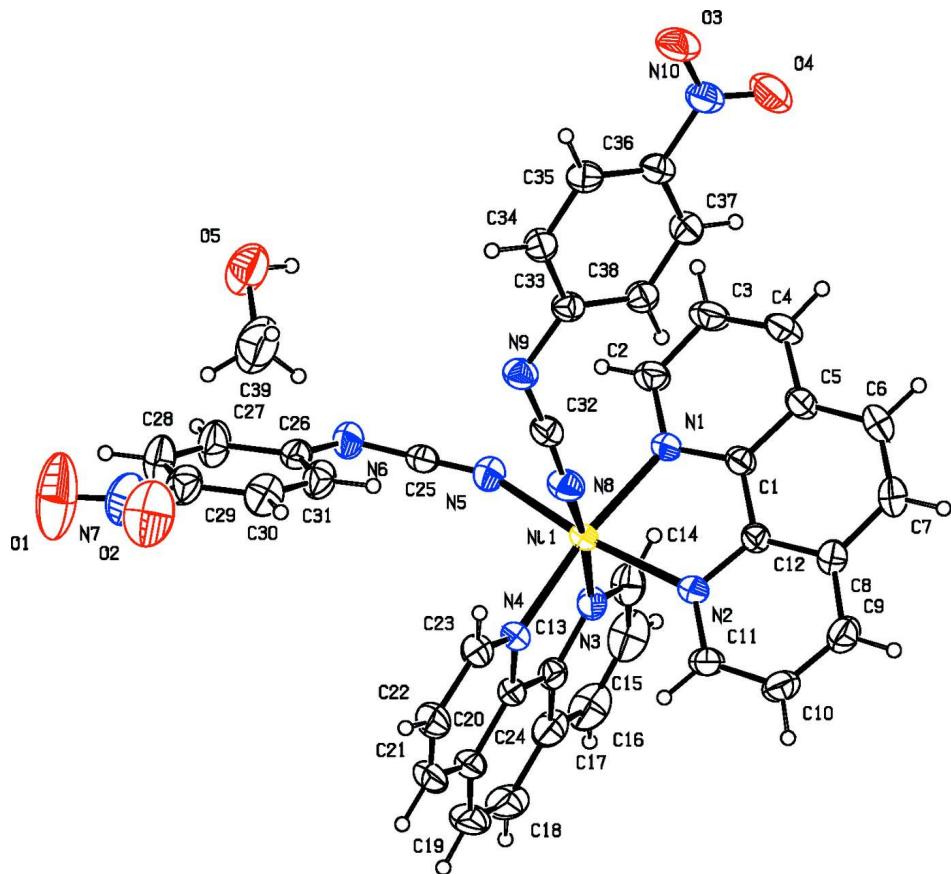

### **Refinement**

The hydrogen atom attached to oxygen atom of the methanol was found in difference Fourier map and refined isotropically with distance restraint of O—H = 0.91 (3) Å. All H atoms bonded to C were positioned geometrically and refined as riding atoms with C—H = 0.93 Å and *U*<sub>iso</sub>(H) = 1.2 *U*<sub>eq</sub>(C) for aromatic C, C—H = 0.96 Å and *U*<sub>iso</sub>(H) = 1.5 *U*<sub>eq</sub>(C) for methyl groups.

### **Computing details**

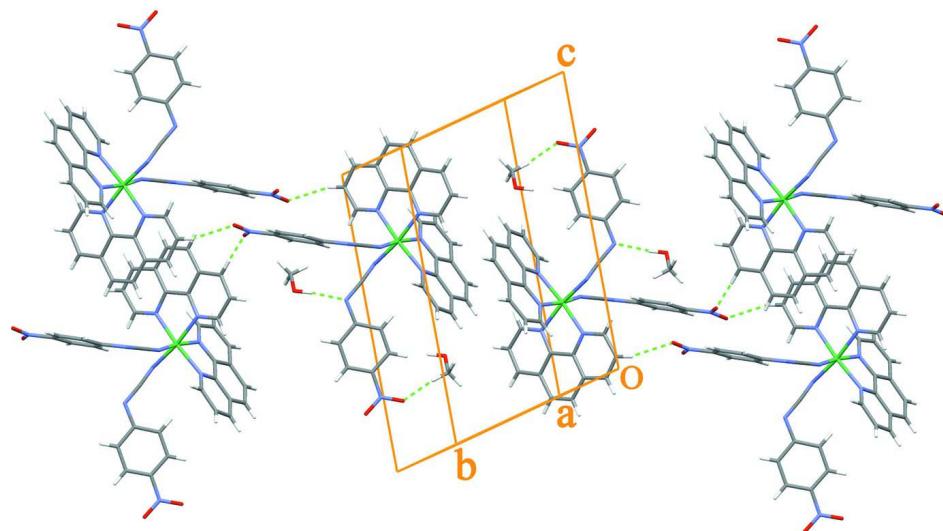

Data collection: *X-AREA* (Stoe & Cie, 2005); cell refinement: *X-AREA* (Stoe & Cie, 2005); data reduction: *X-AREA* (Stoe & Cie, 2005); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure:

SHELXL97 (Sheldrick, 2008); molecular graphics: ORTEP-3 for Windows (Farrugia, 1997); software used to prepare material for publication: WinGX (Farrugia, 1999).

**Figure 1**

$$\Delta\rho_{\min} = -0.31 \text{ e \AA}^{-3}$$

### Special details

**Experimental.** shape of crystal determined optically

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
