Received 29 December 2011; accepted 7 February 2012

Key indicators: single-crystal X-ray study; $T = 223\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; disorder in main residue; R factor = 0.063; wR factor = 0.174; data-to-parameter ratio = 13.9.

The title compound, $\text{C}_6\text{H}_7\text{O}_2\text{S}_3^+\cdot\text{BF}_4^-$, consists of a planar 2-thioxo-1,3-dithiol-4,5-yl unit [maximum deviation from the ring plane = 0.020 (3) Å], with an ethylenedioxy group fused at the 4,5-positions; the ethylenedioxy C atoms are disordered over two positions with site-occupancy factors of 0.5. The 1,4-dioxine ring has a twist-chair conformation. Weak cation-anion S···F interactions [3.022 (4)–3.095 (4) Å] and an S···O [3.247 (4) Å] interaction are present.

2-Methylsulfanyl-5,6-dihydro-2*H*-1,3-dithiolo[4,5-*b*][1,4]dioxin-2-ium tetrafluoroborate

Guoquan Zhou and Xinzhi Chen

Comment

The construction of metal-organic coordination compounds has attracted much attention owing to potential functions, such as permittivity, fluorescence, magnetism and optical properties (Chen *et al.*, 2000; Xiong *et al.*, 1999). We report here the molecular and crystal structures of the title compound, 5,6-dihydro-2-(methylthio)-[1,3]dithiolo[4,5-*b*][1,4]dioxine tetrafluoroborate, **I**. In **I**, (Fig. 1), the inductive effects of the oxygen atoms makes the between C4 and C5 bond length longer (1.493 Å). The C–S bond lengths range 1.681 (4) Å–1.723 (5) Å is small than that typical of C–S bond lengths, 1.82 Å, suggesting a degree of conjugation in the dithiol-2-thione system. Both conformers of the disordered dioxane ring adopt half-chair conformations. In **I**, there are weak S···F interaction (3.095 (4) Å–3.022 (4) Å] and S···O (3.247 (4) Å). These interaction (cation-anion) in the crystal structure, forming a one-dimensional network, see (Fig. 2).

Experimental

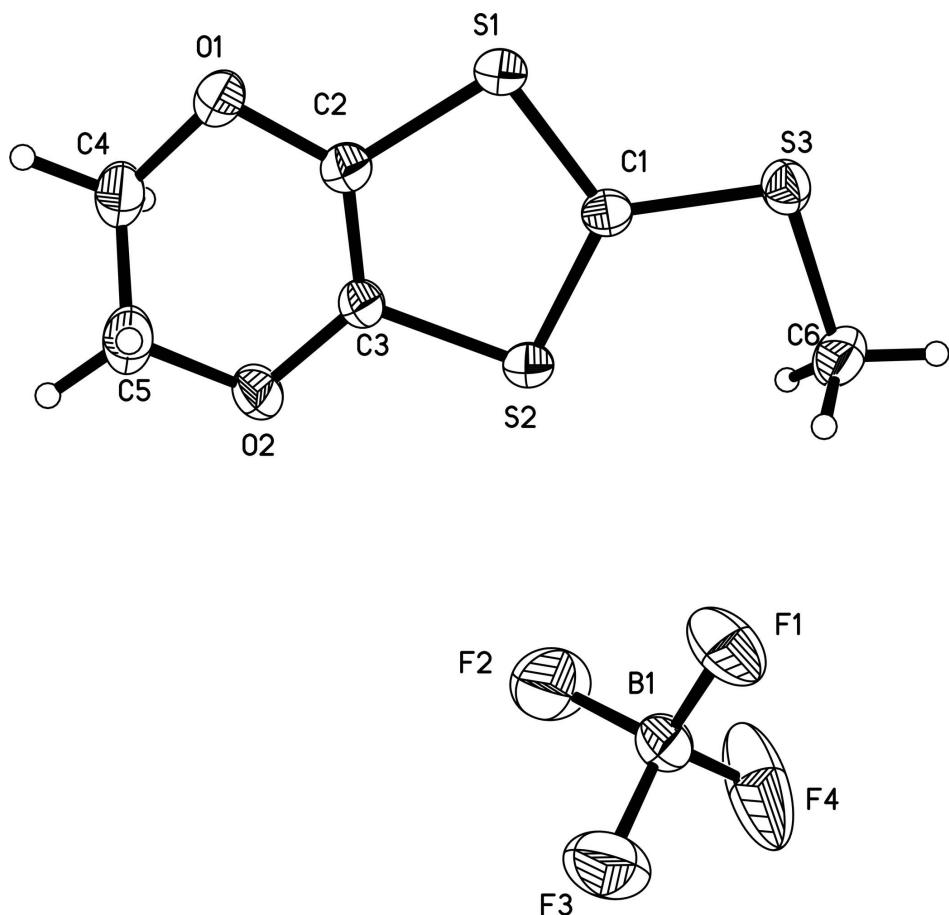

The 5,6-dihydro-[1,3]dithiolo[4,5-*b*][1,4]dioxine-2-thione dissolve in acetonitrile with $[(\text{CH}_3)_3\text{O}]^+ \times [\text{BF}_4]^-$ and get the yellow compound. Slow evaporation of the compound in a solution of THF gave single crystals suitable for *X*-ray analysis.

Refinement

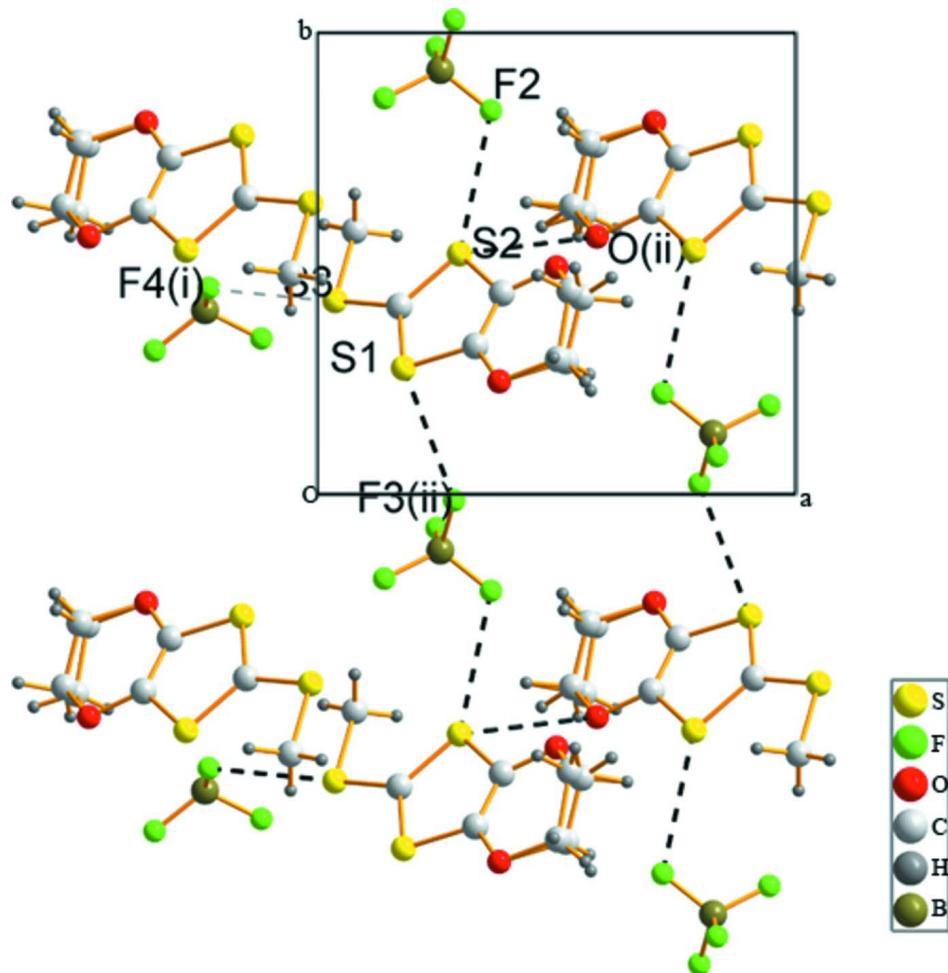

All the H atoms were placed in geometrically calculated positions, with C–H = 0.98 Å (methylene) and 0.97 Å (methyl) and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ (methylene) and 1.5 $U_{\text{eq}}(\text{C})$ (methyl), and refined using a riding model.

Computing details

Data collection: *CrystalClear* (Rigaku, 2005); cell refinement: *CrystalClear* (Rigaku, 2005); data reduction: *CrystalStructure* (Rigaku/MSC, 2005); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXTL* (Sheldrick, 2008).

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as a small spheres of arbitrary radius. Only initial disordered C atoms are presented.

**Figure 2**

The crystal packing diagram view along c axis. Dashed lines indicate the weak interaction. Symmetry codes: (i) $-x$, $-1/2+y$, $1/2-z$; (ii) x , $-1+y$, z ; (iii) $1-x$, $1-y$, $1-z$.

2046 independent reflections
1749 reflections with $I > 2\sigma(I)$

$R_{\text{int}} = 0.026$
 $\theta_{\max} = 25.5^\circ,$ $\theta_{\min} = 3.3^\circ$
 $h = -12 \rightarrow 13$
 $k = -10 \rightarrow 12$
 $l = -11 \rightarrow 12$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.063$
 $wR(F^2) = 0.174$
 $S = 1.07$
2046 reflections
147 parameters
6 restraints
Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0986P)^2 + 1.5661P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.69 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.55 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
