

## 5-(4-Methylphenylsulfonyl)-1,3-dithiolo[4,5-c]pyrrole-2-thione

**Ning-Juan Zheng and Bing-Zhu Yin\***

Key Laboratory of Natural Resources of Changbai Mountain &amp; Functional Molecules (Yanbian University), Ministry of Education, Yanji 133002, People's Republic of China

Correspondence e-mail: zqcong@ybu.edu.cn

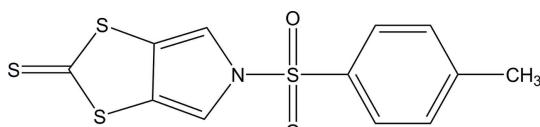

Received 28 February 2012; accepted 5 March 2012

Key indicators: single-crystal X-ray study;  $T = 290\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.029;  $wR$  factor = 0.094; data-to-parameter ratio = 16.5.

The asymmetric unit of the title compound,  $\text{C}_{12}\text{H}_9\text{NO}_2\text{S}_4$ , contains one half-molecule with the N, two S and four C atoms lying on a mirror plane. The molecule exhibits a V-shaped conformation, with a dihedral angle of  $87.00(7)^\circ$  between the benzene and dithiopyrrole rings. The methyl group was treated as rotationally disordered between two orientations in a 1:1 ratio. In the crystal, weak  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds link the molecules into chains in [010].

## 5-(4-Methylphenylsulfonyl)-1,3-dithiolo[4,5-c]pyrrole-2-thione

Ning-Juan Zheng and Bing-Zhu Yin

### Comment

Pyrrolo-annulated tetrathiafulvalenes, an important class of electron-donors, are versatile building blocks in supramolecular and materials chemistry (Becher *et al.*, 2004). As a key precursor to the pyrrolo-annulated tetrathiafulvalenes, 5-Tosyl-5H-[1,3]dithiolo[4,5-c]pyrrole-2-thione, has attracted great attention (Hou *et al.*, 2010). In this paper, we report the crystal structure of the title compound (I).

The asymmetric unit of (I) contains a half of the molecule situated on a mirror plane (Fig. 1). All bond lengths and angles are in the normal ranges and comparable with the reported ones (Hou *et al.* 2009). Atom N1 has a flattened pyramidal environment with the sum of bond angles of 356.9 (2) °. The benzene ring and dithiopyrrole ring form a dihedral angle of 87.00 (7) °. In the crystal, the intermolecular C—H···O hydrogen bonds link the molecules into chains along *b* direction.

### Experimental

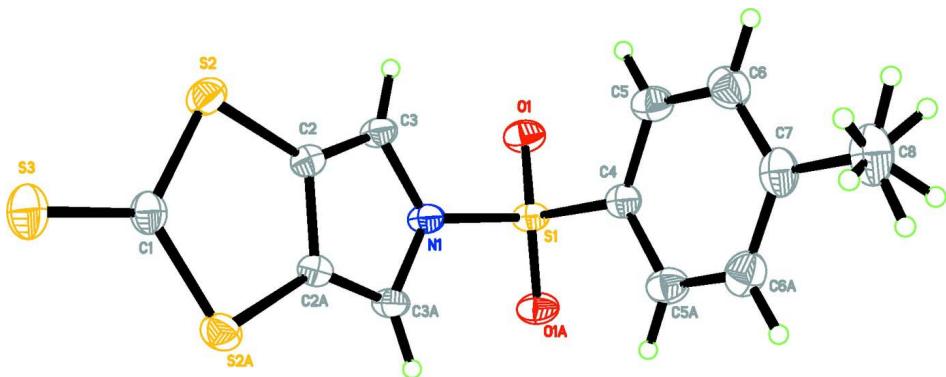

The title compound was prepared according to the literature (Jeppesen *et al.*, 2000). Single crystals suitable for X-ray diffraction were prepared by slow evaporation a mixture of dichloromethane and petroleum (60–90 °C) at room temperature.

### Refinement

C-bound H-atoms were placed in calculated positions (C—H 0.93 and 0.96 Å) and were included in the refinement in the riding model with  $U_{\text{iso}}(\text{H}) = 1.2$  or 1.5  $U_{\text{eq}}(\text{C})$ . The methyl group was treated as rotationally disordered between two orientations in a ratio 1:1.

### Computing details

Extinction coefficient: 0.0106 (12)

*Special details***Experimental.** (See detailed section in the paper)

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
