Received 23 February 2012; accepted 13 March 2012

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.026;  $wR$  factor = 0.080; data-to-parameter ratio = 19.1.

In the title compound,  $\text{C}_{14}\text{H}_{11}\text{BrN}_2\text{O}_4$ , the amide segment makes dihedral angles of  $23.4(2)$  and  $20.5(2)^\circ$  with the benzene rings, while the dihedral angle between the benzene rings is  $2.90(8)^\circ$ . The nitro and methoxy groups are almost coplanar with their bound benzene ring, with the r.m.s. deviation for the 11 non-H atoms being  $0.0265(1)\text{ \AA}$ . An intramolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bond generates an  $S(6)$  ring motif. In the crystal, molecules are linked into  $[2\bar{1}0]$  chains by weak  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{Br}$  interactions, which form an  $R_2^2(8)$  motif between pairs of molecules in the chain. A  $\text{Br}\cdots\text{O}$  [3.2018 (12)  $\text{\AA}$ ] short contact also occurs.

## **4-Bromo-N-(4-methoxy-2-nitrophenyl)benzamide**

**Weerawat Sripet, Suchada Chantrapromma, Pumsak Ruanwas and Hoong-Kun Fun**

### **Comment**

As part of our research in medicinal chemistry, the title benzamide derivative (I) was synthesized with a hope that it may exhibit anticancer and/or anti-alzheimer activities. Herein, its crystal structure was reported.

The molecule of the title benzamide derivative (Fig. 1),  $C_{14}H_{11}BrN_2O_4$ , is not planar as the plane of the middle N-C=O segment makes the dihedral angles of 23.4 (2) and 20.5 (2)  $^{\circ}$  with the C1—C6 and C8—C13 benzene rings, respectively whereas the dihedral angle between the two benzene rings is 2.90 (8)  $^{\circ}$ . In the 4-methoxy-2-nitrophenyl moiety, the nitro and methoxy groups are co-planar with the bound benzene ring with the r.m.s. deviation of 0.0265 (1) Å for the eleven non-H atoms [C8—C14/N2/O2—O4] and the torsion angles O2—N2—C9—C8 = -3.8 (2)  $^{\circ}$ , O3—N2—C9—C8 = 175.88 (15)  $^{\circ}$  and C14—O4—C11—C12 = 3.5 (2)  $^{\circ}$ . An intramolecular N1—H1N1 $\cdots$ O2 hydrogen bond generates a S(6) ring motif (Bernstein *et al.*, 1995). Bond distances are comparable with those in related structures (Johnston & Taylor, 2011; Li & Cui, 2011 and Saeed *et al.*, 2008).

In the crystal (Fig. 2), the molecules are linked into [210] chains by weak C—H $\cdots$ O and C—H $\cdots$ Br interactions forming  $R_2^2(8)$  motifs. Br1 $\cdots$ O2<sup>iii</sup>[3.2018 (12) Å; (iii) = -x, 2-y, -z] short contact is presented.

### **Experimental**

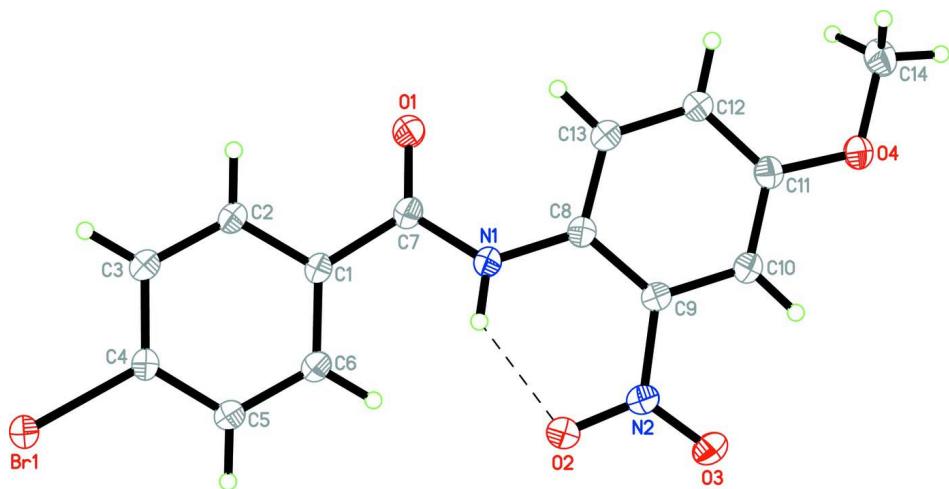

A mixture of 4-bromobenzoyl chloride (0.20 g, 0.91 mmol) and 4-methoxy-2-nitroaniline (0.23 g, 1.40 mmol) in anhydrous acetone (20 ml) was refluxed for 4 h. An orange solid was formed, which was filtered and washed with water. Orange blocks of the title compound were recrystallized from ethylacetate by slow evaporation of the solvent at room temperature after a week, Mp. 434–436 K.

### **Refinement**

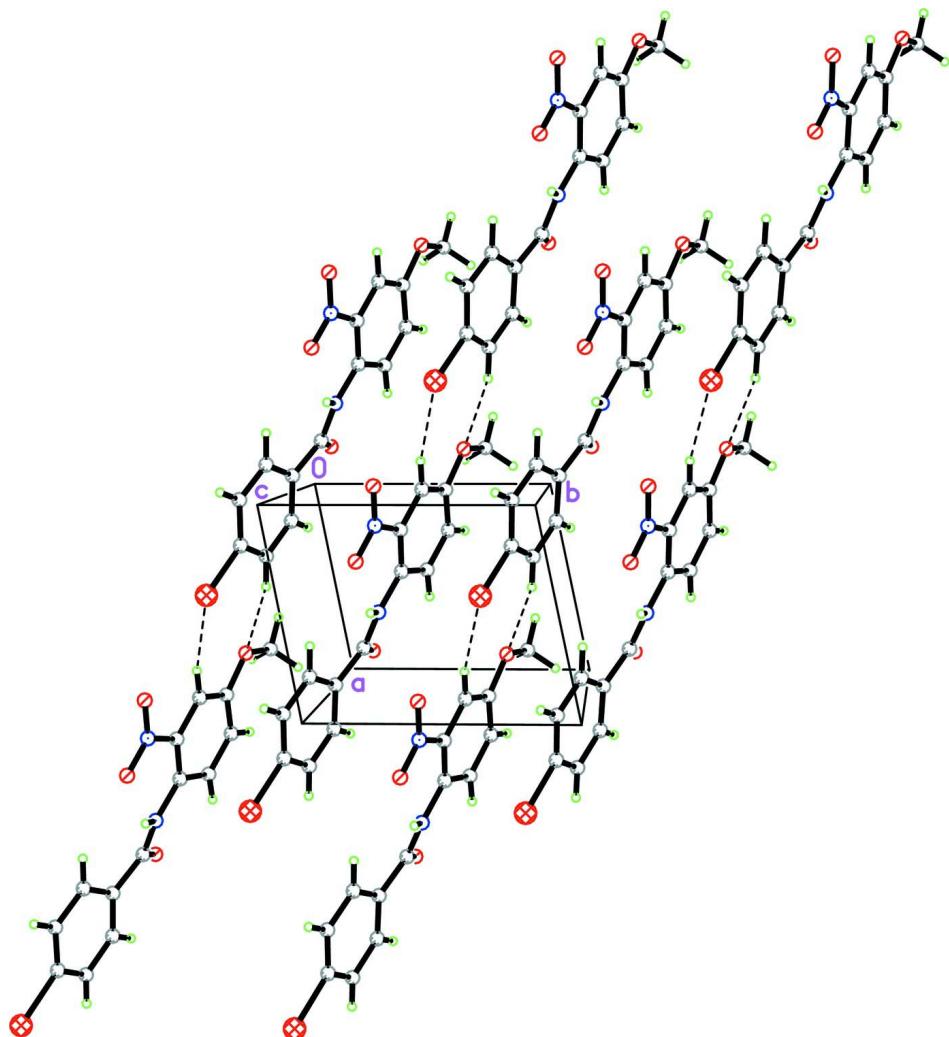

Amide H atom was located in a difference map and refined isotropically. The remaining H atoms were positioned geometrically and allowed to ride on their parent atoms, with d(C—H) = 0.95 Å for aromatic and CH and 0.98 Å for  $CH_3$  atoms. The  $U_{iso}$  values were constrained to be 1.5  $U_{eq}$  of the carrier atom for methyl H atoms and 1.2  $U_{eq}$  for the remaining H atoms. A rotating group model was used for the methyl groups. The highest residual electron density peak is located at 0.75 Å from Br1 and the deepest hole is located at 0.85 Å from Br1.

### **Computing details**

Data collection: *APEX2* (Bruker, 2009); cell refinement: *SAINT* (Bruker, 2009); data reduction: *SAINT* (Bruker, 2009); program(s) used to solve structure: *SHELXTL* (Sheldrick, 2008); program(s) used to refine structure: *SHELXTL* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *SHELXTL* (Sheldrick, 2008) and *PLATON* (Spek, 2009).

Bruker APEX DUO CCD area-detector diffractometer	14195 measured reflections
Radiation source: sealed tube	3725 independent reflections
Graphite monochromator	3558 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.022$
Absorption correction: multi-scan (SADABS; Bruker, 2009)	$\theta_{\text{max}} = 30.0^\circ, \theta_{\text{min}} = 2.9^\circ$
$T_{\text{min}} = 0.281, T_{\text{max}} = 0.616$	$h = -8 \rightarrow 8$
	$k = -10 \rightarrow 10$
	$l = -20 \rightarrow 20$

*Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.026$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.080$	$w = 1/[\sigma^2(F_o^2) + (0.0525P)^2 + 0.2246P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.12$	$(\Delta/\sigma)_{\text{max}} = 0.001$
3725 reflections	$\Delta\rho_{\text{max}} = 0.93 \text{ e \AA}^{-3}$
195 parameters	$\Delta\rho_{\text{min}} = -0.48 \text{ e \AA}^{-3}$
0 restraints	
Primary atom site location: structure-invariant direct methods	

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
