Received 27 March 2012; accepted 5 April 2012

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.040; wR factor = 0.104; data-to-parameter ratio = 12.2.

The Co^{II} ion in the title mononuclear compound, $[\text{Co}(\text{C}_{11}\text{H}_7\text{N}_6)_2(\text{H}_2\text{O})_2]\cdot 2\text{CH}_3\text{OH}$, is located on an inversion center and is six-coordinated in a distorted octahedral geometry defined by four N atoms from two deprotonated 5-(pyrazin-2-yl- κN^1)-3-(pyridin-4-yl)-1H-1,2,4-triazol-1-ide (ppt) ligands and two water molecules. In the crystal, the complex molecules and lattice methanol molecules are linked via $\text{O}-\text{H}\cdots\text{N}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, generating a two-dimensional supramolecular network parallel to (001). $\pi-\pi$ interactions between the triazole and pyrazine rings and between the pyridine rings are present [centroid–centroid distances = 3.686 (3) and 3.929 (4) \AA , respectively].

Yan Bi, Na Wu and Jing Chen

Comment

The selection of organic ligands is generally considered as the critical factor for constructing metallosupramolecular complexes. In this connection, nitrogen-involved polydentate ligands have attracted special attentions because of their preference and reliability for coordinating to transition metal ions in versatile fashions (Guo *et al.*, 2010; Ha, 2011; Sun *et al.*, 2011; Tang *et al.*, 2011; Yang *et al.*, 2010). For example, 5-(pyrazin-2-yl)-3-(pyridin-4-yl)-1H-1,2,4-triazole (Hppt) has been recently used to prepare two Cu(II) complexes with the observation of unique structural transformations (Liu *et al.*, 2009). Herein, the reaction of Hppt with Co(NO₃)₂.6H₂O produces the title mononuclear complex.

The asymmetric unit of the title complex consists of a Co^{II} ion that lies on an inversion center, one deprotonated ppt anion, one water ligand and one lattice methanol molecule. As shown in Fig. 1, the Co^{II} ion takes a distorted octahedral geometry, coordinating to four N atoms from two ppt ligands [Co—N = 2.076 (2) and 2.130 (2) Å] in the equatorial plane and to two axial water ligands [Co—O = 2.087 (2) Å]. The deprotonated ppt ligand adopts a chelating mode through both the pyrazinyl and triazolyl N donors.

As shown in Fig. 2, the lattice methanol molecule is bonded to the water ligand *via* O1—H1A \cdots O2ⁱⁱⁱ and the uncoordinated pyridyl group of the ppt ligand *via* O2—H2 \cdots N6ⁱ hydrogen bonds [symmetry codes: (i) x , $-1+y$, z ; (iii) $-1+x$, y , z], linking the adjacent mononuclear complexes into a two-dimensional network. O1—H1B \cdots N5ⁱⁱ hydrogen bond [symmetry code: (ii) $-x$, $1-y$, $-z$] between the coordinated water and triazole ring is also observed to reinforce this two-dimensional network. In addition, aromatic stacking interactions between the triazolyl (N3—N5, C5, C6) and pyrazinyl (N1, N2, C1—C4) rings as well as between the parallel pyridyl groups (N6, C7—C11) are also found within this supramolecular layer, with centroid–centroid distances and dihedral angles of 3.686 (3)/3.929 (4) Å and 4.2/0.0°.

Experimental

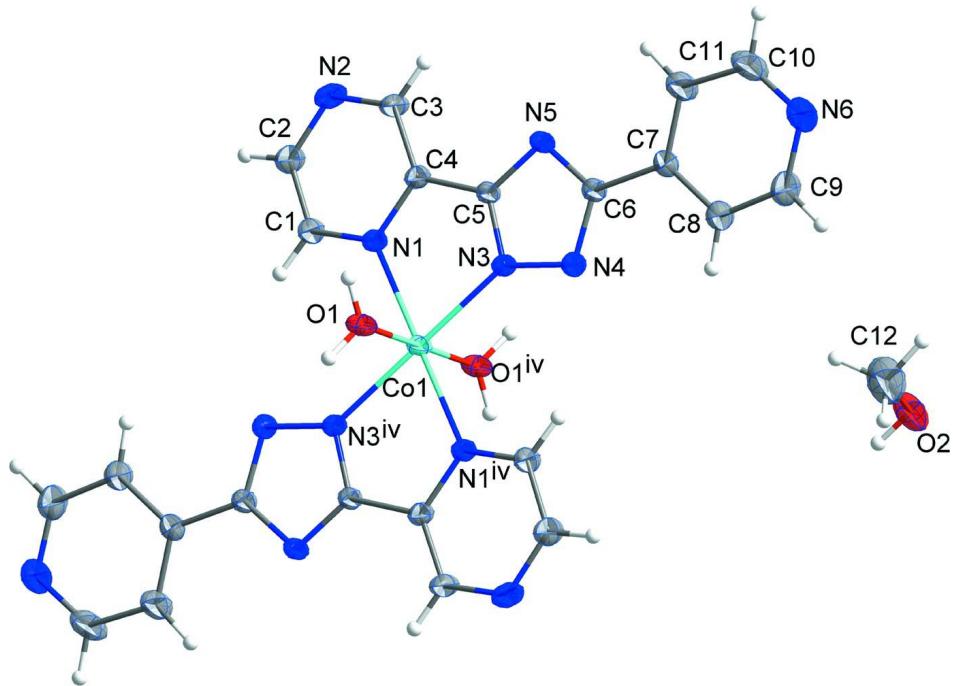

A CH₃OH solution (3 ml) of Hppt (11.2 mg, 0.05 mmol) was carefully layered onto an aqueous solution (5 ml) of Co(NO₃)₂.6H₂O (29.1 mg, 0.1 mmol) in a straight glass tube. After evaporating the solvents slowly for *ca* 1 week, yellow block single crystals suitable for X-ray diffraction analysis were obtained in *ca* 40% yield. Analysis, calculated for C₂₄H₂₆CoN₁₂O₄: C 47.61, H 4.33, N 27.76%; found: C 48.02, H 4.19, N 27.89%.

Refinement

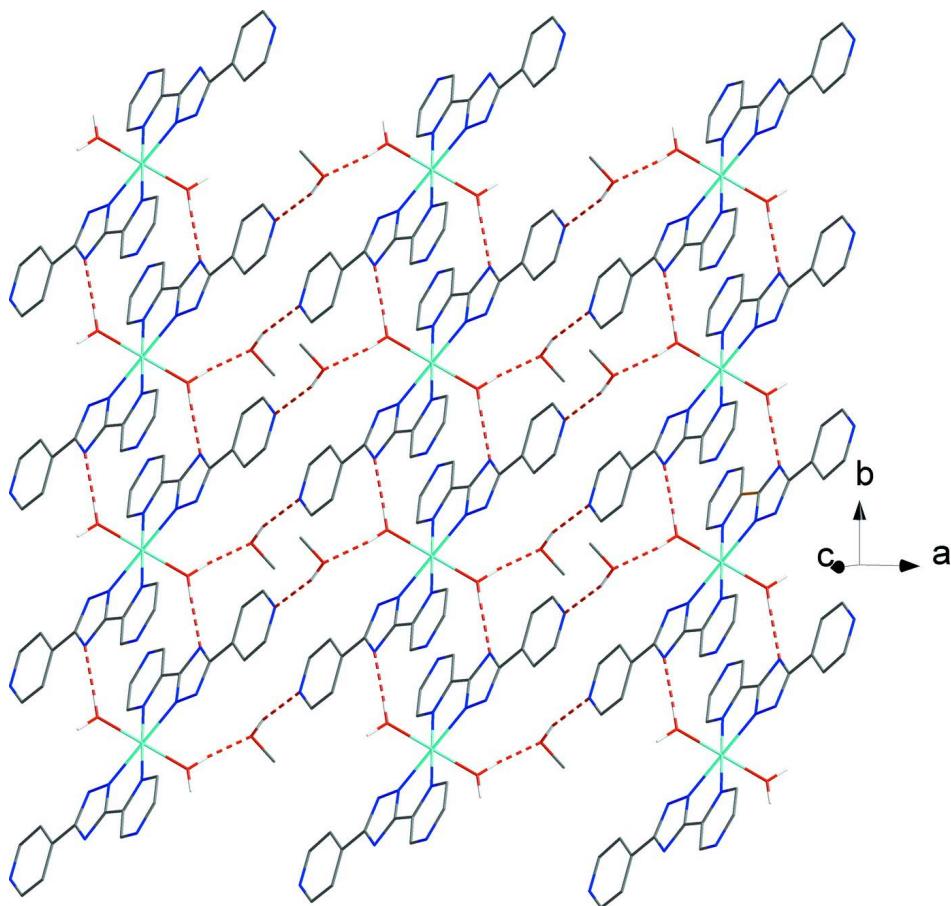

All H atoms were initially located in a difference Fourier map, then constrained to an ideal geometry and refined as riding atoms, with C—H = 0.93 (aromatic) and 0.96 (methyl) Å and O—H = 0.85 (water) and 0.82 (methanol) Å and with U_{iso}(H) = 1.2U_{eq}(C) and 1.5U_{eq}(O).

where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.22 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.31 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
