Received 17 March 2012; accepted 16 April 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.062; wR factor = 0.188; data-to-parameter ratio = 15.1.

In the title compound, $\text{C}_{38}\text{H}_{31}\text{Cl}_4\text{N}_3\text{O}\cdot\text{C}_3\text{H}_6\text{O}$, the 3,7-diazabicyclic exists in a chair-boat conformation. The 4-chlorophenyl groups attached to the chair form are equatorially oriented at an angle of $18.15(3)^\circ$ with respect to each other, whereas the 4-chlorophenyl groups attached to the boat form are oriented at an angle of $32.64(3)^\circ$. In the crystal, molecules are linked by $\text{N}-\text{H}\cdots\pi$ and $\text{C}-\text{H}\cdots\text{O}$ interactions.

2,4,6,8-Tetrakis(4-chlorophenyl)-3,7-diazabicyclo[3.3.1]nonan-9-one O-benzyl-oxime acetone monosolvate

Dong Ho Park, V. Ramkumar and P. Parthiban

Comment

The 3,7-diazabicyclo[3.3.1] nonan-9-one nucleus is widely present in Lupin alkaloids and are displaying various biological actions (Parthiban *et al.*, 2009, 2010, Asakawa, 1995, Jayaraman & Avila, 1981). In fact, the biological activities mainly depends on the nature of the substituents and their positions on the nucleus. Since C=N—O-R is an important class of pharmacophore by displaying biological actions, we have synthesized the title molecule by the condensation of 3,7-diazabicyclo[3.3.1]nonan-9-one and *O*-benzyl moiety to make the biologically potent oxime derivative. Because the biological actions mainly depend on the stereochemistry of the molecule, we undertaken the title molecule for the present study to explore its stereochemistry.

The crystallographic parameters *viz.*, torsion angles, asymmetry parameters and ring puckering parameters calculated for the title compound shows that one of the piperidone rings, N(1)—C(1)—C(2)—C(7)—C(5)—C(6) adopts a near ideal chair conformation, according to Cremer & Pople and Nardelli. The total puckering amplitude, Q_T is 0.606 (3) Å, the phase angle θ is 2.7 (3)° and phi is 261 (6)° (Cremer & Pople, 1975). The smallest displacement asymmetry parameters q_2 and q_3 are 0.031 (3) and 0.605 (3) Å, respectively (Nardelli, 1983). On the otherhand, another piperidone ring N(2)—C(3)—C(2)—C(7)—C(5)—C(4) exists in the boat conformation according to C&P by Q_T = 0.764 (3), θ = 91.9 (2)° and phi = 357.0 (3)° as well as Nardelli by q_2 = 0.764 (3) and q_3 = -0.025 (3)°.

An equatorial orientation of the 4-chlorophenyl groups attached on the chair form piperidone is supported by the angles of C(1)—C(8) and C(6)—C(26) on the C&P plane normal as 70.85 (19) and 75.04 (19)°, respectively (Luger & Bülow, 1983). The equatorial orientations of the aryl groups are further supported by thier torsion angles; the C8—C1—C2—C7 is 178.4 (3)° and C26—C6—C5—C7 is 177.0 (3)°. The 4-chlorophenyl groups attached on the boat form of the piperidone have angles with C&P plane normal are C(3)—C(14) = 57.34 (19)° and C(4)—C(20) = 61.70 (19)°, they are respectively in bisectional and equatorial orientations according to Luger & Bulow. In fact, both lies on the boundary of bisectional and this is further supported by their torsion angles as follows: C7—C2—C3—C14 = 115.5 (3)° and C20—C4—C5—C7 = -121.6 (3)°.

The 4-chlorophenyl groups attached on the chair form are equatorially oriented at an angle of 18.15°, respect to each other, whereas, the 4-chlorophenyl groups attached to the boat form are oriented at an angle of 32.64° between them.

Based on the above analysis, it is clear that the title compound exists in the chair-boat conformation with an equatorial orientation of the 4-chlorophenyl groups on both sides of the secondary amino group of the piperidone in the chair conformation.

The crystal packing is stabilized by weak intermolecular N—H···π (C14—C19) and C—H···O interactions.

Experimental

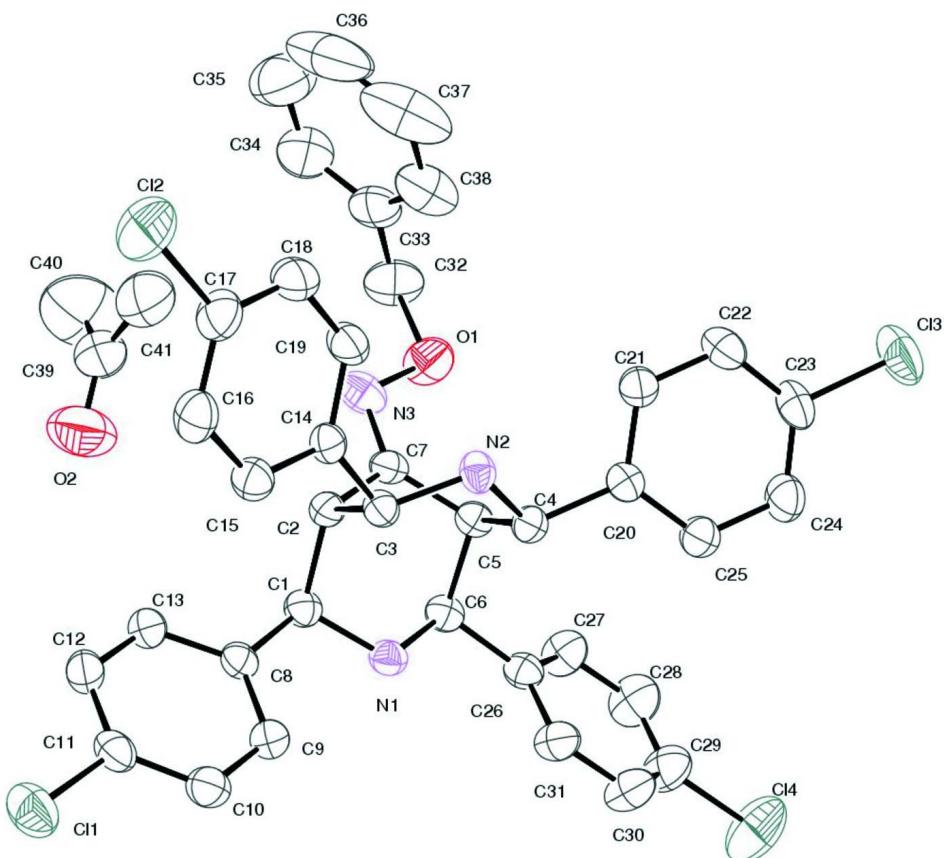

The 2,4,6,8-tetrakis(4-chlorophenyl)-3,7-diazabicyclo[3.3.1]nonan-9-one was synthesized by a modified Mannich condensation in one-pot, using 4-chlorobenzaldehyde (0.2 mol, 28.12 g), acetone (0.05 mol, 3.7 ml) and ammonium acetate (0.1 mol, 7.7 g) in a 50 ml of absolute ethanol (Parthiban *et al.*, 2008). The mixture was gently warmed on a hot plate at 303 K (30° C) with moderate stirring till the complete consumption of the starting materials, which was monitored by TLC. At the end, the crude 3,7-diazabicycle was separated by filtration and gently washed with 1:5 cold ethanol-ether mixture. The pure 2,4,6,8-tetrakis(4-chlorophenyl)-3,7-diazabicyclo[3.3.1]nonan-9-one (0.01 mol, 5.823 g) was condensed with *O*-benzylhydroxylamine hydrochloride (0.012 mol, 1.915 g) using sodium acetate trihydrate (0.03 mol, 3.06 g) as base in ethanol-chloroform 1:1 mixture to obtain the title oxime ether. Colourless prisms were obtained by slow evaporation of an acetone solution.

Refinement

The nitrogen H atom was located in a difference Fourier map and refined isotropically. Other hydrogen atoms were fixed geometrically and allowed to ride on the parent carbon atoms with aromatic C—H = 0.93 Å, aliphatic C—H = 0.98 Å and methylene C—H = 0.97 Å. The displacement parameters were set for phenyl, methylene and aliphatic H atoms at $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and for methyl H atoms at $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$.

 $\Delta\rho_{\text{min}} = -0.29 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg3 is the centroid of the C8—C13 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C13—H13···O2	0.93	2.52	3.441 (6)	172
N2—H2A···Cg3 ⁱ	0.88 (3)	2.85 (3)	3.637 (3)	150 (3)

Symmetry code: (i) $-x+1/2, y+3/2, -z+1/2$.
