Received 24 March 2012; accepted 12 April 2012

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.004$ Å; R factor = 0.037; wR factor = 0.110; data-to-parameter ratio = 14.5.

The title compound, $\text{C}_{16}\text{H}_{16}\text{N}_2\text{O}_2\text{S}_2$, has been synthesized by several different high-yield routes, and has been encountered as a co-product in a number of reaction pathways, ever since it became of interest to our research program over 30 years ago. We now confirm the proposed molecular structure in which the molecule exhibits a twofold axis of symmetry through the mid-point of the S—S bond and the two planes defined by the (carbamoyl)sulfonyl moieties are essentially perpendicular to each other [dihedral angle = $81.55(14)^\circ$].

Bis(*N*-methyl-*N*-phenylcarbamoyl)disulfane

Alayne L. Schroll, Maren Pink and George Barany

Comment

Bis(*N*-methyl-*N*-phenylcarbamoyl)disulfane (C₁₆H₁₆N₂O₂S₂) was first reported by Kobayashi *et al.* (1973). The compound became of interest to our research program over thirty years ago (Barany *et al.*, 1983; Schroll and Barany, 1986) and has been synthesized by several different high-yield routes, as well as encountered as a co-product in a number of reaction pathways (Barany *et al.*, 1983; Schroll and Barany, 1986; Schrader *et al.*, 2011). We now confirm the molecular structure of the title compound by single-crystal X-ray analysis. The disulfane reported herein is the flagship of the homologous series of bis(*N*-methyl-*N*-phenylcarbamoyl)polysulfanes, C₁₆H₁₆N₂O₂S_{*n*}, which have been prepared and structurally characterized for *n* = 1–6.

The title compound exhibits a twofold axis of symmetry through the center of the S–S bond, and all bond distances and angles are within expected ranges. The N–C bond distance is 1.35 Å, consistent with ~60% double bond character, with the consequence that the (carbamoyl)sulfonyl atoms (S1,C1,O1,N1,C2,C3) are in a plane. The aromatic ring is nearly perpendicular to the (carbamoyl)sulfonyl plane, with a torsion angle of 92.5° (C2–N1–C3–C4). The S–S bond length of 2.03 Å is slightly shorter than the 2.07 Å reported for the S–S bond length in elemental sulfur (S₈), suggesting that some partial double bond character extends through the S–S bond due to its adjacency to carbonyl groups on both sides. Several other reference compounds also have an S–S bond length of 2.01–2.03 Å (Bereman *et al.*, 1983; Rout *et al.*, 1983; Paul and Srikrishnan, 2004; Fun *et al.*, 2001; Raya *et al.*, 2005; Li *et al.*, 2006; Singh *et al.*, 2011). The most noteworthy feature of the title compound is the torsion angle about the disulfane, which is 81.6° and as such is somewhat smaller than the theoretical optimum of 90.0° (Pauling, 1949; Torrico-Vallejos *et al.*, 2010) that has been explained as allowing for minimal mutual repulsion of *pπ* orbital electron lone pairs in sulfur. A comparable deviation from theory was reported for dibenzoyl disulfide (Rout *et al.*, 1983; Paul & Srikrishnan, 2004), where the torsion angle is 80.8°. Bis(*N*-methyl-*N*-phenylthiocarbamoyl)disulfane, which only differs from the title compound by two thiocarbonyls in place of two carbonyls, has a torsion angle about the disulfane of 89.8° and shows a conformation that is not completely superimposable on the title compound (Fun *et al.*, 2001).

Note regarding nomenclature: The title compound is named in a manner that is consistent with our prior publications. The closely related C₁₆H₁₆N₂S₄ was named bis(*N*-methyl-*N*-phenylthiocarbamoyl) disulfide by Fun *et al.* (2001), but we have chosen the "disulfane" revised name for consistency.

Table 1 Selected geometric parameters (Å, °)

N1–C1	1.345 (3)
N1–C2	1.461 (3)
N1–C3	1.442 (2)
C1–O1	1.209 (2)

C1–S1 1.825 (2)

S1–S1 2.0262 (11)

C2–N1–C3–C4 92.5 (3)

C1–S1–S1–C1 81.55 (14)

Symmetry operator (*a*): $-x + 1, y, -z + 1/2$

Experimental

The title compound was prepared in high yield from the reaction of *N*-methylaniline with bis(chlorocarbonyl)disulfane, and recrystallized from hot carbon tetrachloride/chloroform (3:2) in 60–85% recovery or from hot acetone in 75% recovery (Barany *et al.*, 1983).

Refinement

H atoms were positioned geometrically and refined using a riding model with C–H = 0.93 Å (aromatic) or 0.96 Å (methyl), and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for aromatic and $1.5U_{\text{eq}}(\text{C})$ for methyl H atoms.

 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.21 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.18 \text{ e } \text{\AA}^{-3}$

Special details

Refinement. Refinement of F^2 against all reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on all data will be even larger.
