Received 9 April 2012; accepted 21 April 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; disorder in main residue; R factor = 0.047; wR factor = 0.129; data-to-parameter ratio = 13.0.

In the title compound, $\text{C}_{26}\text{H}_{27}\text{BrN}_3\text{O}_3\text{P}$, the central pyrazole ring forms a dihedral angle of $71.7(2)^\circ$ with the bromophenyl ring. In the crystal, molecules are linked by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, forming inversion dimers with $R_2^2(10)$ ring motifs. Four C atoms of the 3-phenyl ring are disordered over two sets of sites [site occupancies = 0.745 (6) and 0.225 (6)].

Diethyl [(2-bromoanilino)(1,3-diphenyl-1*H*-pyrazol-4-yl)methyl]phosphonate

G. Suresh, V. Sabari, A. Nandakumar, P. T. Perumal and S. Aravindhan

Comment

Pyrazoles exhibit a variety of pharmacological properties for e.g antibacterial and anti-inflammatory activities (Sullivan *et al.*, 2006; Patel *et al.*, 2010). In view of their importance, the crystal structure determination of the title compound was carried out and the results are presented here.

X-Ray analysis confirms the molecular structure and atom connectivity as illustrated in Fig. 1. The bond lengths N2—C13 and N3—C14 are normal and comparable to the corresponding values observed in the related structure of 3-(3-Chloroanilino)-1-(3,5-dimethyl-1*H*-pyrazol-1-yl)propan-1-one (Saeed *et al.*, 2009). The central pyrazole ring and the bromophenyl ring are almost perpendicular with the dihedral angle of 71.7 (2)°, whereas the two phenyl rings are twisted from the pyrazole ring as can be seen from the dihedral angle of 15.0 (1)° and 39.3 (3)°, respectively. The pyrazole ring system is essentially planar, with maximum deviation of 0.006 (4) for atom C14. The sum of bond angles around N2[359.7 (3)°] of the pyrazole ring is in accordance with sp^3 hybridization. The atoms Br1 and N1 are deviated by -0.039 (1) Å and 0.019 (3) Å from the leastsquares plane of the benzene(C1—C6) ring. The four carbon atoms in the phenyl ring are disordered over two sets of sites [site occupancies = 0.745 (6) and 0.225 (6)].

The phosphinite group assumes an extended conformation as can be seen from torsion angles P1—O2—C8—C9 of -179.0 (5)°. A pair of N1—H1···O1 hydrogen bonds at x, y, z and $-x, 1 - y, 2 - z$ form a cyclic centrosymmetric dimer [$R_{2}^{2}(10)$]. These hydrogen bonds are crosslinked to Br1 to form S(5) ring (C1—C6—N1—H1—Br1) motif. The crystal packing is stabilized N—H···O hydrogen bonds.

Experimental

A mixture of 1,3-diphenyl-1*H*-pyrazole-4-carbaldehyde (1 mmol), 2-bromoaniline (1 mmol), diethyl phosphite (1.5 mmol), and potassium hydrogen sulfate (20 mol-%) under neat condition was stirred at room temperature. After completion of the reaction as indicated by TLC, it was poured into water and extracted with ethyl acetate. The organic layer was dried over sodium sulfate and concentrated under vacuum. The crude product was chromatographed.

Refinement

The four carbon atoms in one of the phenyl ring are disordered over two positions (C22/C22', C23/C23', C25/C25' and C26/C26') with refined occupancies of 0.745 (6) and 0.225 (6). The corresponding bond distances involving the disordered atoms were restrained to be equal. All H atoms were fixed geometrically and allowed to ride on their parent C atoms, with C—H distances fixed in the range 0.93–0.97 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methyl H 1.2 $U_{\text{eq}}(\text{C})$ for other H atoms.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
