Received 7 May 2012; accepted 7 May 2012

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.053; wR factor = 0.159; data-to-parameter ratio = 18.4.

Molecules of the title compound, $[\text{Co}(\text{C}_{12}\text{H}_8\text{Cl}_2\text{N}_3)_3]$, lie on a threefold rotation axis. The tris- N,N' -chelated Co^{III} atom, which is located on the threefold rotation axis, shows a distorted octahedral coordination.

Gang Yu, Shu-Zhong Zhan and Seik Weng Ng

Comment

The diaryltriazenido anion N,N' -chelates to a large number of metal atoms; for Co^{III} in particular, three diphenyltriazenido anions chelate to the metal atom to render a trigonal prismatic coordination geometry. Such a geometry appears to be a consequence of the small bite of the chelate (Krigbaum & Rubin, 1973). In chlorine-substituted Co(C₁₂H₈Cl₂N₃)₃ (Scheme I), the metal atom lies on a threefold rotation axis that relates one di(4-chlorophenyl)triazenido chelate to the others (Fig. 1). The Co^{III} atom shows octahedral coordination (Fig. 2). With respect to the delocalized –N–N=N– fragment, one phenylene ring is twisted by 9.5 (3) Å and the other by 21.1 (2) °.

Experimental

4-Chloroaniline (10 mmol) in water (5 ml) was suspended in 1 M hydrochloric acid (30 ml) at 273 K. An aqueous solution (15%) of sodium nitrite (15 mmol) was added dropwise. When the amine had dissolved, a solution of 4-chloroaniline in ethanol (10 mmol) was added at 273 K. The mixture was stirred for 3 h. The reaction mixture was neutralized with a 15% aqueous of sodium acetate to give an orange precipitate. The product was collected and crystallized at 269 K from 9:1 ethyl acetate/n-hexane to give yellow crystals in (65% yield). Calc. for C₁₂H₈Cl₂N₃: C 54.16, H 3.41, N 15.79%. Found: C 54.07, H 3.39, N 15.66%.

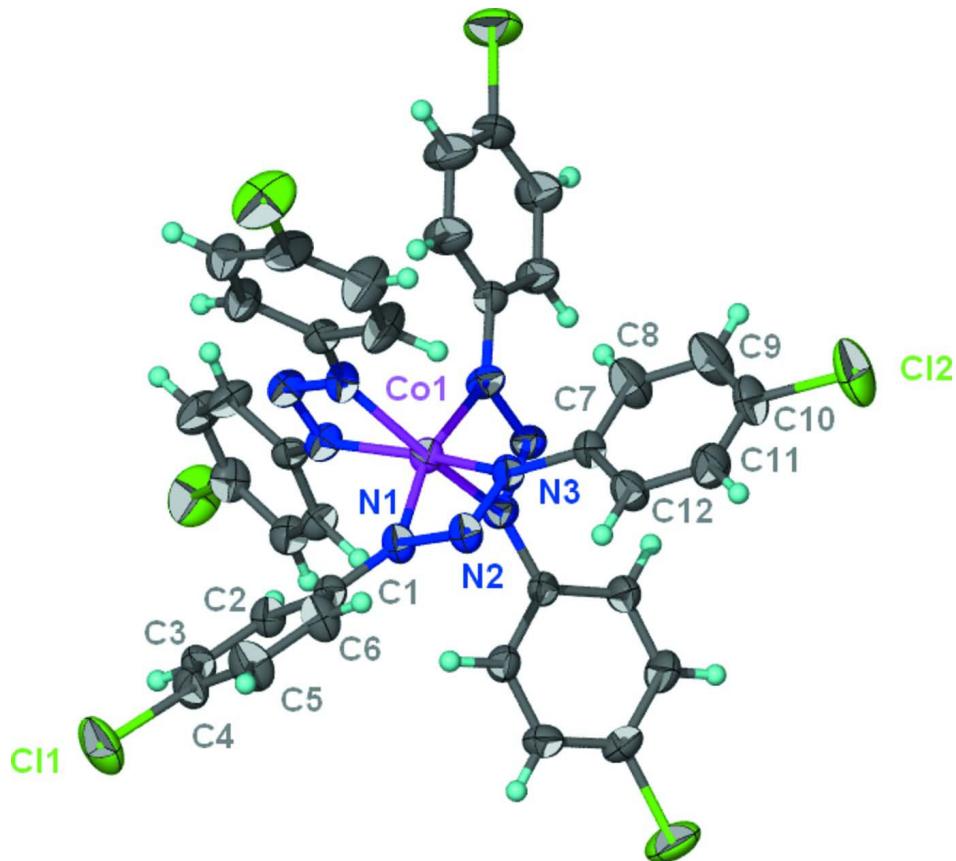

To a solution of the ligand (0.798 g, 3 mmol) and triethylamine (0.300 g, 3 mmol) in dichloromethane/acetonitrile (30 ml, 1:1) was added cobalt(II) chloride hexahydrate (0.238 g, 1 mmol). The solvent was allowed to evaporate over several days. Red crystals were isolated in 50% yield. Calc. for C₃₆H₂₄CoN₉Cl₆: C 50.59, H 2.81, N 14.76%. Found: C 51.19, H 2.68, N 14.81%.

Refinement

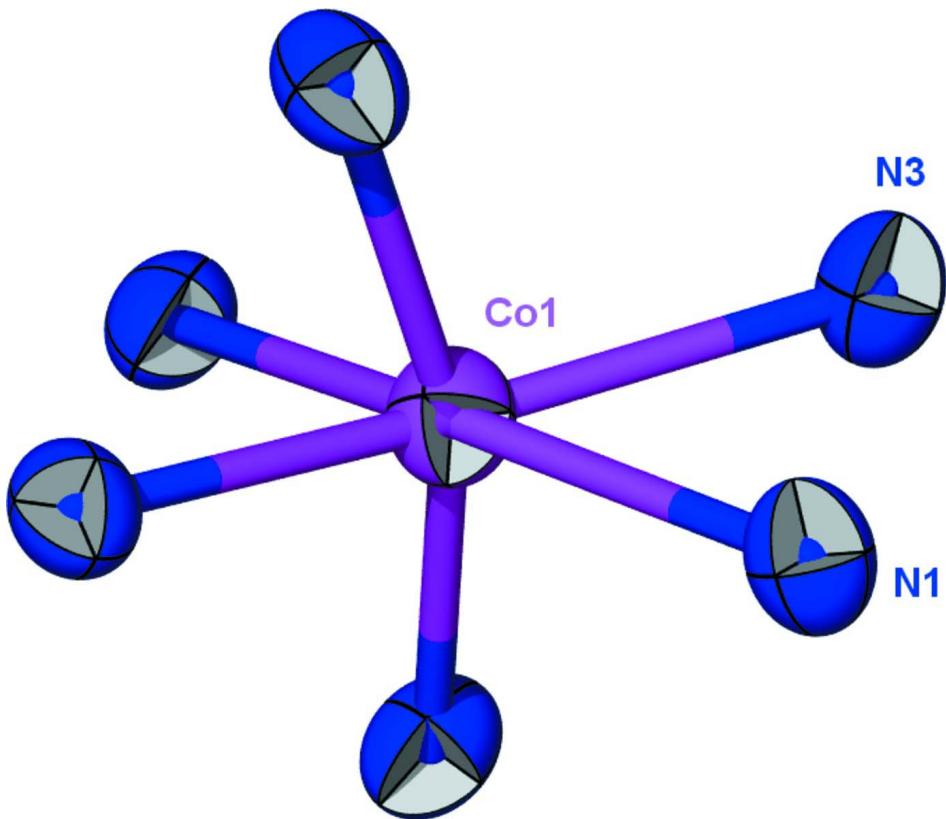

H-atoms were placed in calculated positions (C—H 0.93 Å) and were included in the refinement in the riding model approximation, with $U(H)$ set to 1.2 $U(C)$.
