Received 26 April 2012; accepted 16 May 2012

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.039; wR factor = 0.107; data-to-parameter ratio = 13.8.

In the complex cation of the title compound, $[\text{Mn}(\text{C}_7\text{H}_5\text{O}_4)(\text{C}_{12}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})](\text{C}_7\text{H}_5\text{O}_4)\cdot 0.5\text{H}_2\text{O}$, the Mn^{II} atom has a six-coordinate octahedral environment defined by one carboxylate O atom belonging to a 2,6-dihydroxybenzoate (DHB) ligand, four N atoms from two chelating 1,10-phenanthroline molecules and one water molecule. The lattice water molecule lies on a twofold rotation axis. Intramolecular O—H···O hydrogen bonds are present in the DHB anions and complex cations. Intermolecular O—H···O hydrogen bonds link two cations, two anions and one water molecule into a dimer. $\pi-\pi$ interactions between the pyridine and benzene rings and between the benzene rings are also observed [centroid–centroid distances = 3.7774 (16), 3.7912 (16) and 3.7310 (17) \AA].

Aqua(2,6-dihydroxybenzoato- κO^1)bis(1,10-phenanthroline- $\kappa^2 N,N'$)manganese(II) 2,6-dihydroxybenzoate hemihydrate

Quanwei Li, Li He and Hongxiao Jin

Comment

Dihydroxybenzoate is a good ligand in the construction of coordination complexes. Several dihydroxybenzoate manganese(II) complexes have been reported (Garribba *et al.*, 2004). In our previous paper, we reported a mononuclear neodymium(III) complex containing 2,6-dihydroxybenzoate ligands (Zheng *et al.*, 2010). Herein, we reported the synthesis and crystal structure of a mononuclear manganese(II) complex formed by 2,6-dihydroxybenzoate and 1,10-phenanthroline ligands (Fig. 1).

Experimental

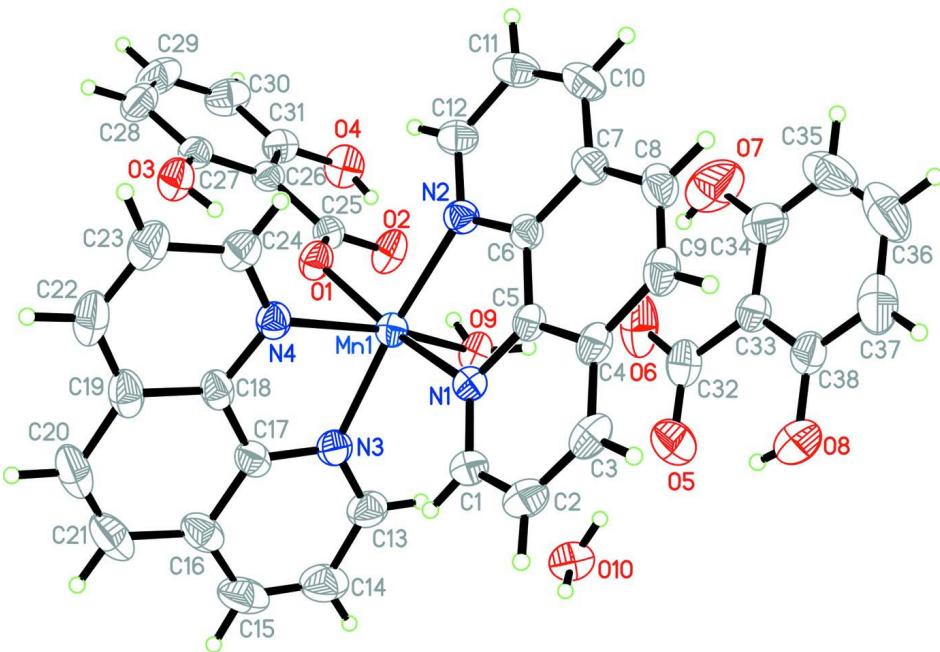

All reagents were commercially available and of analytical grade. Mn(CH₃CO₂)₂.6H₂O (0.123 g, 0.5 mmol), 2,6-dihydroxybenzoic acid (0.074 g, 0.5 mmol), 1,10-phenanthroline (0.090 g, 0.5 mmol) and NaHCO₃ (0.042 g, 0.5 mmol) were dissolved in a water–ethanol solution (10 ml, 1:1 v/v). The solution was refluxed for 4 h and filtered after cooling to room temperature. Orange single crystals were obtained from the filtrate after 14 days.

Refinement

H atoms were positioned geometrically and refined as riding, with C—H = 0.93 and O—H = 0.82 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}(\text{O})$. Water H atoms were located from a difference Fourier map and refined as riding, with O—H = 0.85 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
