Key indicators: single-crystal X-ray study; $T = 150\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.031; wR factor = 0.070; data-to-parameter ratio = 15.8.

The title compound, $(\text{C}_{14}\text{H}_{16}\text{N})[\text{Sn}(\text{C}_6\text{H}_5)_3(\text{C}_2\text{O}_2)]$, was synthesised by allowing $\text{C}_2\text{O}_4(\text{Bz}_2\text{NH}_2)_2$ (Bz = benzyl) to react with SnPh_3Cl . The asymmetric unit is built up by four $\text{SnPh}_3\text{C}_2\text{O}_4$ anions and four Bz_2NH_2 cations which are related by a pseudo-inversion centre. Each Sn^{IV} cation is five-coordinated by the three phenyl groups and two O atoms belonging to the chelating oxalate ligand; the coordination geometry is that of a distorted trigonal bipyramidal. Anions and cations are linked through N–H···O hydrogen bonds into a layer structure parallel to (001). Moreover, the anion–cation pairs are associated by two bifurcated N–H···O hydrogen bonds, generating pseudo-dimers. One of the phenyl groups of one anion is disordered over two sets of sites in a 0.69:0.31 ratio. The Flack parameter value of 0.44 (1) indicates racemic twinning.

Dibenzylazanium ($\text{oxalato-}\kappa^2\text{O},\text{O}'\text{)triphenylstannate(IV)}$)

Ndongo Gueye, Libasse Diop, Kieran C. Molloy and Gabrielle Kociok-Köhn

Comment

New organotin (IV) compounds are of interest because of their physical applications (Evans & Karpel, 1985). The X-ray structure of $\text{C}_2\text{O}_4\text{SnPh}_3\text{Cy}_2\text{NH}_2$ were reported by (Ng & Kumar Das, 1995; Ng & Hook, 1999; Ng & Rae, 2000); it consists of two $[\text{C}_2\text{O}_4\text{SnPh}_3]^-$ anions connected into dimers by identical N—H—O hydrogen bonds. We have modified the counter ion by using Bz_2NH_2 .

The asymmetric unit is build up by the association of four $\text{C}_2\text{O}_4\text{SnPh}_3$ anions and four Bz_2NH_2 cations (Fig. 1, Table 1). In each anion, the oxalate ion chelates the SnPh_3 residue. Sn atoms are in pentagonal environments. Anion and cation are linked by N—H···O hydrogen bonds. Moreover, anion and cation pairs are associated by two bifurcated N—H···O hydrogen bonds into a pseudo dimer (Table 2, Fig. 1). The type of dimers observed in the title compound is different from the one reported by Ng & Rae (2000). The Sn—O bonds (Table 1) indicate asymmetrical chelation.

Experimental

When an ethanolic solution of $(\text{Bz}_2\text{NH}_2)_2\text{C}_2\text{O}_4$ is mixed with a similar solution of SnPh_3Cl in 1/2 ratio, crystals of $\text{Bz}_2\text{NH}_2\text{C}_2\text{O}_4\text{SnPh}_3$ suitable for X-ray work were obtained after slow evaporation.

All the chemicals were from ALDRICH and used without any further purification.

Refinement

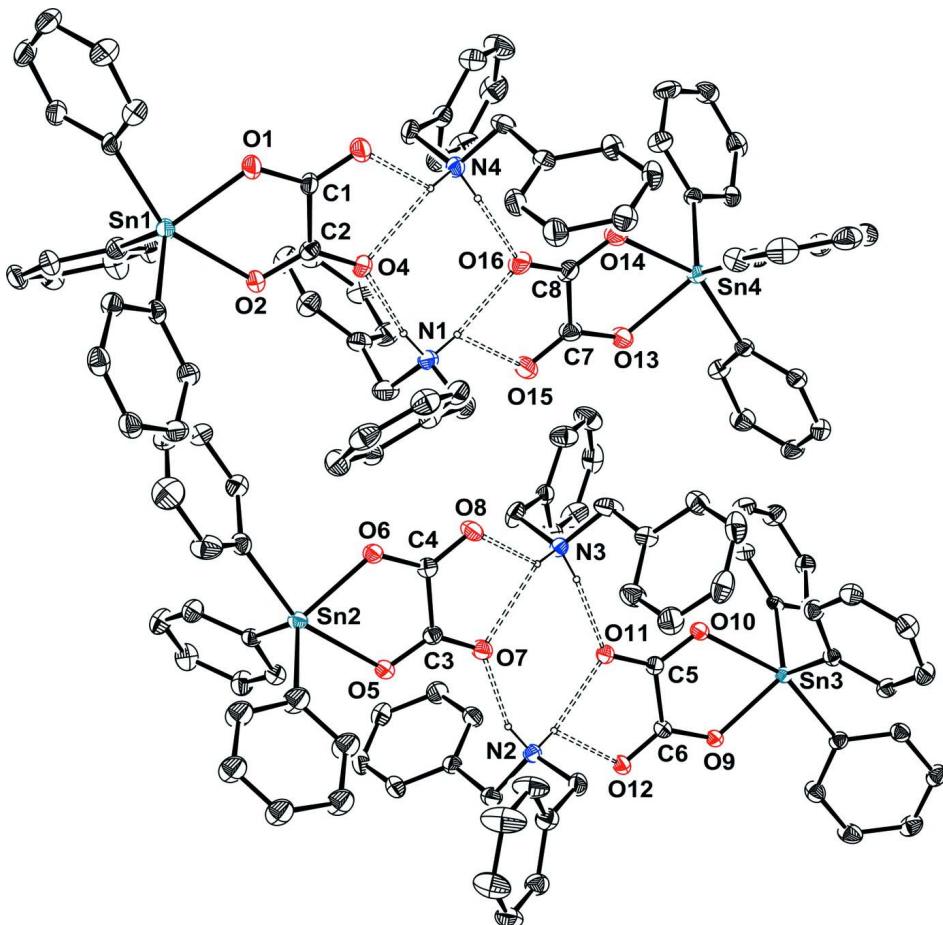

All H atoms attached to C and N atoms were fixed geometrically and treated as riding with C—H = 0.98 Å (methyl) or 0.97 Å (methylene) and N—H = 0.86 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C or N})$.

One of the phenyl group attached to Sn2 is disordered over two positions by rotation around the central C—C axis with occupancy factor in the ratio 0.69/0.31. The C—C distances and C—C—C angles were restrained to reasonable dimensions by using the SAME instruction available within *SHELXL97* (Sheldrick, 2008). The anisotropic thermal parameters were severely restrained using the EADP instruction.

The value of the Flack's parameters is indicative of a twin by inversion (racemic twinning). Although, ADDSYM within *PLATON* (Spek, 2009) detects (pseudo) centre of symmetry, no model could be correctly refined in the centrosymmetric $\bar{\text{P}1}$ space group.

Computing details

Data collection: *COLLECT* (Nonius, 1997); cell refinement: *SCALEPACK* (Otwinowski & Minor, 1997); data reduction: *SCALEPACK* (Otwinowski & Minor, 1997); program(s) used to solve structure: *SIR97* (Altomare *et al.*, 1999); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *ORTEPIII* (Burnett & Johnson, 1996), *ORTEP-3 for Windows* (Farrugia, 1997) and *PLATON* (Spek, 2009); software used to prepare material for publication: *SHELXL97* (Sheldrick, 2008).

**Figure 1**

View of the unit cell with the atom numbering scheme. Ellipsoids are drawn at the 30% probability level. H atoms are drawn as small spheres of arbitrary radii. N—H···O hydrogen bonds are represented by dashed lines. H atoms attached to C atoms have been omitted for the sake of clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
