Received 7 April 2012; accepted 21 April 2012

Key indicators: single-crystal X-ray study; $T = 113$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å;
 R factor = 0.041; wR factor = 0.095; data-to-parameter ratio = 9.8.

There are two independent molecules in the asymmetric unit of the title compound, $\text{C}_{30}\text{H}_{44}\text{O}_5$. They comprise a triterpenoid skeleton of five six-membered rings and a five-membered lactone ring. The five six-membered rings are all *trans*-fused. In both independent molecules the *D* rings adopt a slightly distorted half-chair conformation due the presence of the lactone ring while the other four six-membered rings all adopt chair conformations. The characteristic carbon-carbon double bond of the oleanic skeleton is absent. Intermolecular O—H...O hydrogen bonds between the hydroxy and carbonyl groups occur in the crystal structure.

12 α -Hydroxy-3,27-dioxoleanano-28,13-lactone

Jun-yi Hu, Gang-gang Wu, Ying-qian Xu, Guo-yong Xiao and Peng Lei

Comment

Pentacyclic triterpene acids such as oleanolic acid, crataegolic acid and ursolic acid and their glycosides are widely distributed in the plant kingdom. They exhibit a variety of pharmacological properties such as analgesic (Gene *et al.*, 1996), cytotoxic (Hu *et al.*, 2009), and immunosuppressive activities (Xu *et al.*, 2007). Recently, our laboratories have disclosed the design and synthesis of a novel series of oleanolic acid derivatives. Herewith, we report the synthesis and crystal structure of the title compound. The title compound crystallizes with two molecules per asymmetric unit (Fig. 1). Each molecule contains a five-membered lactone ring and five *trans*-fused cyclohexane rings *via* A(C1—C5, C10), B(C5—C10), C(C8, C9, C11—C14), D(C13—C18) and E(C17—C22) in the molecule A, respectively, and A'(C31—C35, C40), B'(C35—C40), C'(C38, C39, C41—C44), D'(C43—C48) and E'(C47—C52) in the molecule B, respectively. The characteristic carbon double bond of oleanolic skeleton is absent in the title compound. Ring A(A'), B(B'), C(C') and E(E') adopt chair conformations, while ring D(D') adopts a slightly distorted half-chair conformation as a result of the formation of the lactone ring. The hydroxy groups attached to atom C12 and C42 are equatorial. The intermolecular O—H \cdots O hydrogen bonds were observed between the hydroxy groups and carbonyl groups (Table 1) which stabilize the crystal structure.

Experimental

Commercially available oleanolic acid and Jones reagent in dry CH₂Cl₂/acetone (1/1) was stirred at 278 K for 1 h to give 3-oxoolean-12-en-28-oic acid. Reaction of 3-oxoolean-12-en-28-oic acid with O₃ in CH₂Cl₂/MeOH (1:1) at 223 K gave 12-hydroxy-3-oxooleanano-28,13-lactone. A stream of NOCl was introduced to an ice-cold solution of 12-hydroxy-3-oxooleanano-28,13-lactone in pyridine at 233 K over 30 min to give lactone nitrite. A solution of lactone nitrite in acetone was irradiated by high pressure Hg lamp through a Pyrex filter under nitrogen atmosphere for 1 h to give oxime. To a solution of oxime in dioxane and AcOH, aqueous TiCl₃ was added under ice, keeping temperature of 299 K by cooling, for 4 h to give imine. To imine in dioxane and AcOH, an aqueous solution of NaNO₂ was added for 1 h to obtain the title compound. Crystals suitable for X-ray structure analysis were obtained by slow evaporation of a solution in methanol at room temperature.

Refinement

H atoms of the hydroxy group were located in a difference density map and refined freely. Other H atoms were positioned geometrically and refined as riding (C—H = 0.95–1.00 Å) and allowed to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ or $1.5U_{\text{eq}}$ (parent). The absolute configuration could not be established because of the absence of significant anomalous effects. Friedel pairs were merged for the final cycles of refinement.

Computing details

Data collection: *CrystalClear* (Rigaku, 2007); cell refinement: *CrystalClear* (Rigaku, 2007); data reduction: *CrystalClear* (Rigaku, 2007); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *SHELXTL* (Sheldrick, 2008); software used to prepare material for publication: *CrystalStructure* (Rigaku, 2007).

 $\Delta\rho_{\min} = -0.23 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
