Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.049;  $wR$  factor = 0.149; data-to-parameter ratio = 18.7.

The asymmetric unit of the title compound,  $C_{19}H_{20}N_2O_3$ , contains two independent molecules in both of which the pyrrolidine ring adopts an envelope conformation, but with a C atom as the flap in one molecule and the N atom in the other. The pyran ring adopts a half-chair conformation in both molecules. In the crystal, molecules are linked via  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds and  $\text{C}-\text{H}\cdots\pi$  interactions.

### Comment

In order to obtain detailed information on its molecular conformation, the X-ray structure of the title compound has been determined and is discussed here.

The geometric parameters of the title molecule (Fig. 1) agree well with reported similar structure (Chitra Devi *et al.*, 2011). The pyrrolidine rings make the dihedral angle of 54.29 (9) $^{\circ}$  and 40.05 (9) $^{\circ}$  with benzene rings of chromeno moiety for both the molecules. In both the molecules, the average dihedral angle between methyl benzene ring and pyrrolidine ring is 66.83 (9) $^{\circ}$ . The sum of bond angles around N1 [331.9 (3) $^{\circ}$ , 329.15 (4) $^{\circ}$ ] and around N2 atom [359.9 (5) $^{\circ}$ , 360.2 (5) $^{\circ}$ ] indicate  $sp^3$  and  $sp^2$  hybridizations in two molecules, respectively.

The pyran ring adopts half-chair conformation, with the puckering parameters (Cremer & Pople, 1975) of  $q_2 = 0.3472$  (16) Å,  $q_3 = 0.2945$  (15) Å,  $\varphi = 97.6$  (2) $^{\circ}$ , in one molecule and in the other molecule  $q_2 = 0.3655$  (17) Å,  $q_3 = 0.2930$  (17) Å,  $\varphi = 77.4$  (2) $^{\circ}$ . The crystal packing is stabilized by C—H $\cdots$ O and C—H $\cdots$  $\pi$  interactions. Atom C15 donating one proton to O1' at ( $x, y - 1, z$ ) and the C4' atom in the other molecule donating one proton to O2 at ( $-x + 1, -y + 1, -z$ ) form C—H $\cdots$ O hydrogen bonds.

### Experimental

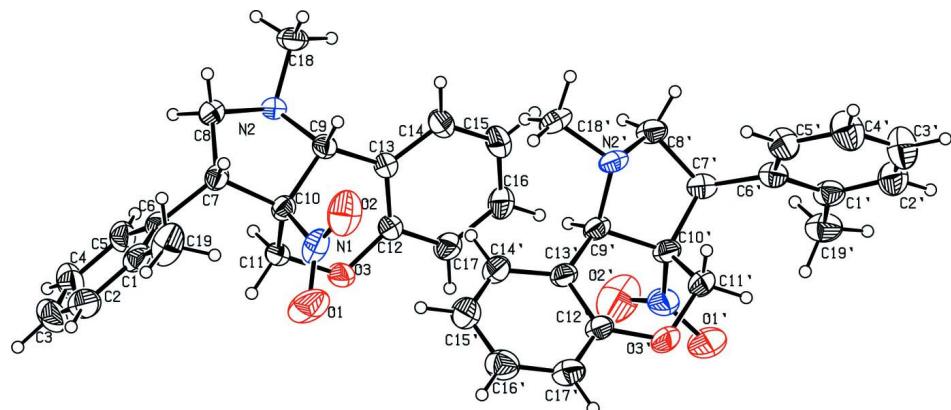

A mixture of (2E)-methyl-2-(2-formylphenoxy)methyl-3-phenylacrylate (2 mmol, 0.592 g) and sarcosine (2 mmol, 0.178 g) in acetonitrile (8 ml) was refluxed for 5 h. After the completion of the reaction as indicated by TLC, the reaction mixture was concentrated and the resulting crude mass was diluted with water (15 ml) and extracted with ethyl acetate (3  $\times$  15 ml). The combined organic layer obtained was washed with brine (2  $\times$  10 ml) and dried over anhydrous Na2SO4. The organic layer was concentrated and purified by column chromatography on silica gel (Acme 100–200 mesh), ethyl acetate: hexane (1: 9) to afford the pure methyl 1,2,3,3a,4,9 b-hexahydro-1-methyl-3-phenyl chromeno[4,3-b] pyrrole-3a-carboxylate as colourless solid in 91% (0.588 g) yield.

### Refinement

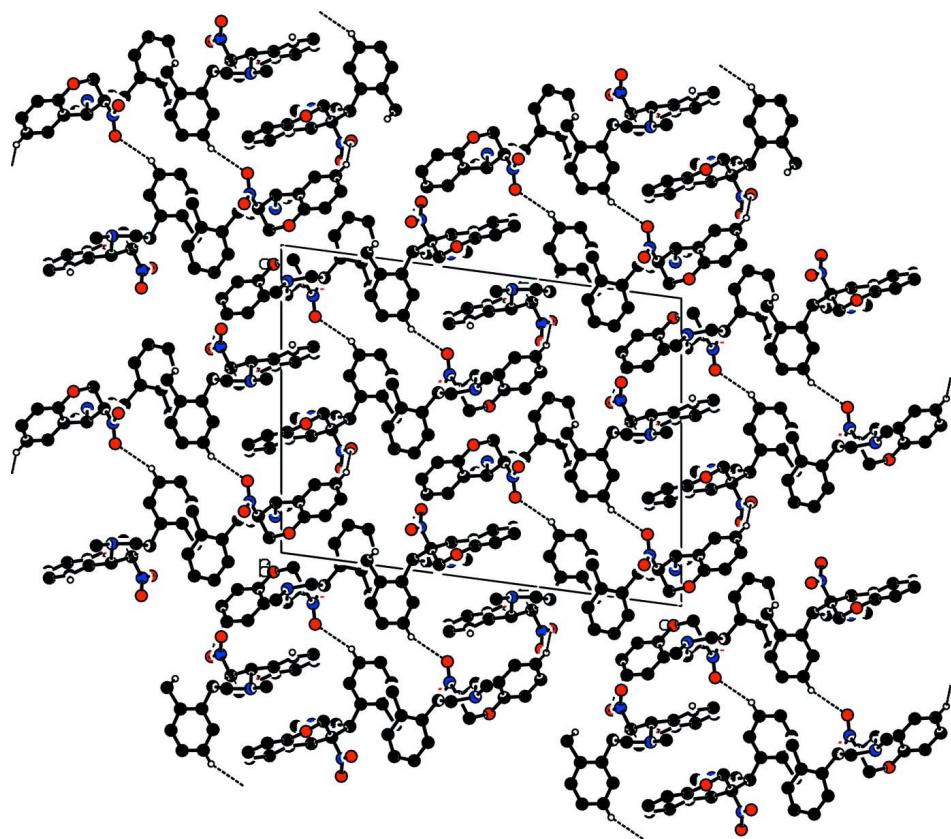

H atoms were positioned geometrically (C—H = 0.93–0.98 Å) and allowed to ride on their parent atoms, with 1.5  $U_{eq}$ (C) for methyl H and 1.2  $U_{eq}$ (C) for other H atoms.

### Computing details

 $\Delta\rho_{\min} = -0.24$  e Å<sup>-3</sup>

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg11 and Cg3 are the centroids of the C12'—C17' and C1—C6 rings, respectively.

D—H···A	D—H	H···A	D···A	D—H···A
