Key indicators: single-crystal X-ray study; $T = 273\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.028; wR factor = 0.076; data-to-parameter ratio = 9.5.

The title complex, $[\text{Mn}_2(\text{C}_{18}\text{H}_4\text{O}_{10})(\text{H}_2\text{O})_4]_n$, was synthesized from manganese(II) chloride tetrahydrate and 9,10-dioxo-9,10-dihydroanthracene-1,4,5,8-tetracarboxylic acid (H_4AQTC) in water. The anthraquinone unit is located about a crystallographic center of inversion. Each asymmetric unit therefore contains one Mn^{II} atom, two water ligands and one half AQTC^{4-} anion. The Mn^{II} atom is coordinated in a distorted octahedral geometry by four O atoms from three AQTC^{4-} ligands and two water O atoms. Two of the carboxylate groups coordinate one Mn^{II} atom in a chelating mode, whereas the others each coordinate two Mn^{II} atoms. Each AQTC^{4-} tetra-anion therefore coordinates six different Mn^{II} ions and, as a result, a three-dimensional coordination polymer is formed. $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, some of them bifurcated, between water ligands and neighboring water or anthraquinone ligands are observed in the crystal structure.

Poly[tetraqua(μ_6 -9,10-dioxo-9,10-dihydroanthracene-1,4,5,8-tetracarboxylato)dimanganese(II)]

Rui Xu and Jian-Lan Liu

Comment

Porous solid materials, such as MOFs (metal-organic frameworks) have been widely studied for their potential applications in gas absorption, separation, catalysis and magnetic materials. Explorations of advanced porous materials for these applications are an intense subject of scientific research (Li *et al.*, 1999; Li *et al.*, 2012; Cheng *et al.*, 2010; Hong *et al.*, 2009; Miller & Gatteschi, 2011; Liu *et al.*, 2010.) Herein we report the crystal structure of the title compound.

The molecular structure of (I) is illustrated in Fig. 1., a summary of the observed hydrogen bonds and the corresponding angles are given in Table 1.

Each asymmetric unit therefore contains one manganese(II) atom, two water ligands and one half AQTC⁴⁻ ligand. The coordination sphere around manganese is distorted octahedral due to the coordination of four O atoms from three AQTC⁴⁻ ligands and two O atoms from two water molecules. Two of the carboxylate groups coordinate one manganese in a chelating mode whereas the others each coordinate two manganese center. Each AQTC⁴⁻ therefore coordinates six different manganese ions and as a result a three-dimensional coordination polymer is formed.

Experimental

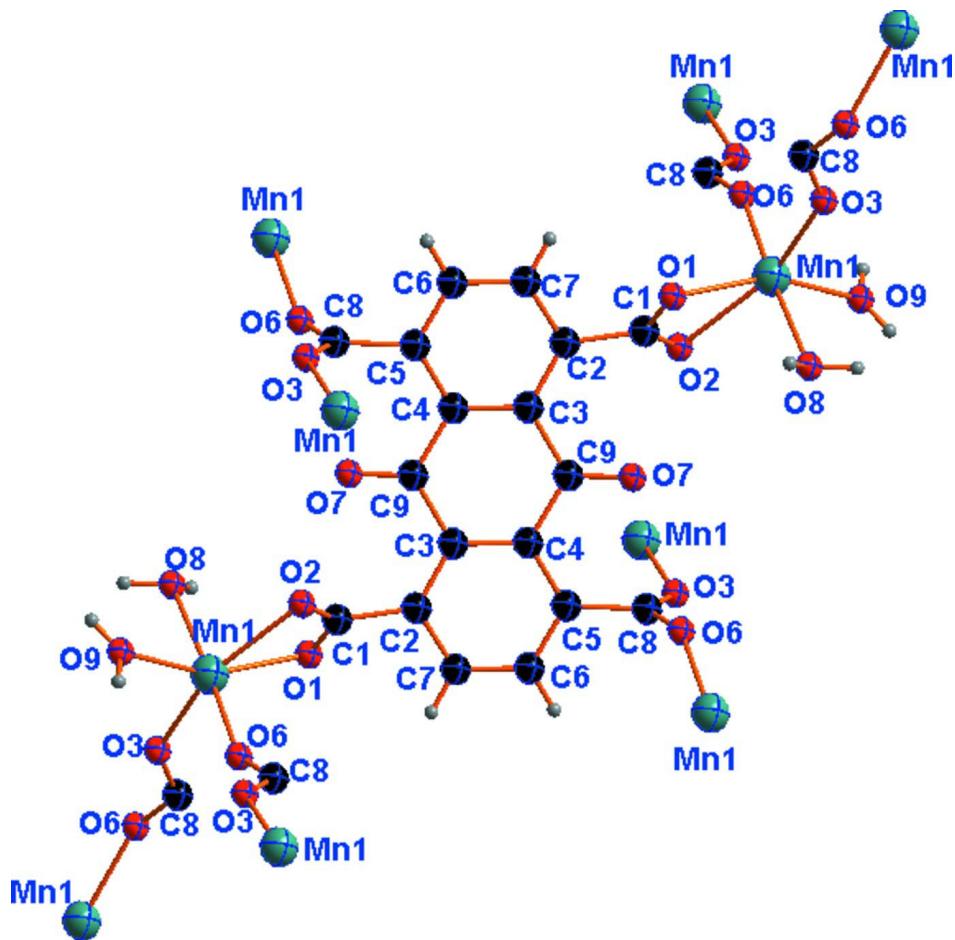

A mixture of 9,10-dioxo-9,10-dihydroanthracene-1,4,5,8-tetracarboxylic acid (H₄AQTC; 0.025 mmol, 9.8 mg) was added to distilled water (4 ml) and ultra-sounded for 10 min. The pH value of the mixture was then adjusted to 7.0 with sodium hydroxide (0.5 mol L⁻¹), prior to the addition of manganese(II) chloride tetrahydrate (0.05 mmol, 9.9 mg). The reactants were placed in a Teflon-lined stainless steel vessel, heated for 3 days, and then cooled to ambient temperature over 12 h. The solution was exposed to air for three days leading to the precipitation of brown crystals (yield 10%).

Refinement

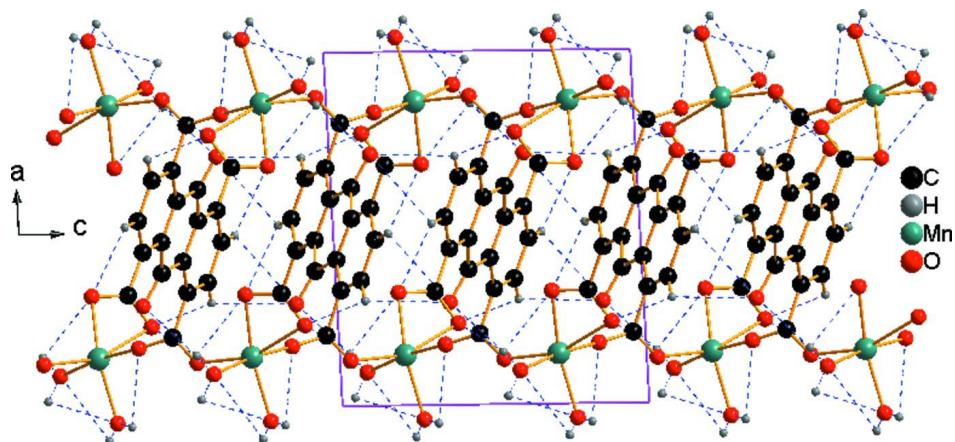

All non-hydrogen atoms were refined anisotropically. H atoms of the H₂O ligands were determined in difference Fourier maps and refined isotropically with distance restraints for O9—H5 and O9—H6 of 0.82 Å. H atoms of AQTC⁴⁻ ligands calculated in idealized positions with C—H = 0.93 Å and refined as riding atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Computing details

Data collection: SMART (Bruker, 2000); cell refinement: SAINT (Bruker, 2000); data reduction: SAINT (Bruker, 2000); program(s) used to solve structure: SHELXS97 (Sheldrick, 2008); program(s) used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphics: SHELXTL (Sheldrick, 2008); software used to prepare material for publication: SHELXTL (Sheldrick, 2008).

**Figure 1**

One repeating unit of the coordination polymer, showing displacement ellipsoids at the 30% probability level. [Symmetry codes: (#1) $x + 1, -y, -z + 1$; (#2) $x + 1, y + 1/2, -z + 1/2$; (#3) $x + 1, -y + 1, -z + 1$; (#4) $x + 1, y - 1/2, -z + 1/2$.]

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.028$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.076$	$w = 1/[\sigma^2(F_o^2) + (0.0357P)^2 + 0.3487P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1609 reflections	$\Delta\rho_{\text{max}} = 0.35 \text{ e } \text{\AA}^{-3}$
170 parameters	$\Delta\rho_{\text{min}} = -0.41 \text{ e } \text{\AA}^{-3}$
2 restraints	
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
