Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.064; wR factor = 0.190; data-to-parameter ratio = 29.2.

Three independent molecules comprise the asymmetric unit of the title compound, $C_{23}H_{20}\text{ClF}_3\text{N}_4\text{S}$. The conformations of the molecules are similar with the chlorobenzene and CF_3 -benzene rings almost perpendicular to, and almost co-planar with, the pyrimidinyl ring [range of dihedral angles = 80.36 (13)–88.07 (14) and 11.89 (14)–23.30 (14) $^\circ$, respectively]; the benzene rings are roughly orthogonal to each other [64.81 (16)–72.16 (15) $^\circ$]. In the crystal, two of the independent molecules associate *via* weak $\text{N}-\text{H}\cdots\text{N}(\text{cyano})$ hydrogen bonds and 12-membered $\{\cdots\text{HNC}_3\text{N}\}_2$ synthons; the third independent molecule self-associates similarly but about a centre of inversion. The sample studied was found to be a non-merohedral twin and the minor twin component refined to 47.16 (7)%.

2-[(4-Chlorobenzyl)sulfanyl]-4-(2-methylpropyl)-6-[3-(trifluoromethyl)-anilino]pyrimidine-5-carbonitrile

Ali A. El-Emam, Omar A. Al-Deeb, Nasser R. El-Brollosy, Seik Weng Ng and Edward R. T. Tiekink

Comment

The chemotherapeutic efficacy of pyrimidine derivatives is related to their ability to inhibit vital enzymes responsible for DNA bio-synthesis. Thus, several pyrimidine non-nucleoside derivatives are known to exhibit anti-cancer (Al-Safarjalani *et al.*, 2005), anti-viral (Brunelle *et al.*, 2007; Ding *et al.*, 2006) and anti-bacterial activities (Al-Abdullah *et al.*, 2011). In continuation to our interest in the chemical and pharmacological properties of pyrimidine derivatives (Al-Omar *et al.*, 2010; El-Emam *et al.* 2011), we synthesized the title compound (I) as potential a chemotherapeutic agent.

In (I), Fig. 1, three independent molecules comprise the asymmetric unit, and these have very similar molecular conformations as seen in the overlay diagram, Fig. 2. With respect to the pyrimidinyl ring, the chlorobenzene and CF₃-benzene rings form dihedral angles of 80.36 (13) and 11.89 (14)°, respectively, for the N1-containing molecule; the dihedral angle between the benzene rings is 69.50 (14)°. For the N5-containing molecule the dihedral angles are 88.07 (14), 23.30 (14) and 64.81 (16), respectively, and for the N9-containing molecule, the angles are 85.94 (14), 13.81 (14) and 72.16 (15)°, respectively. In each case, the 2-methylpropyl group is orientated in the same direction as the chlorobenzene ring.

In the crystal structure, the N1- and N5-containing molecules associate to form a two molecule aggregate *via* N—H···N(cyano) hydrogen bonds and 12-membered {···HNC₃N}₂ synthons, Table 1 and Fig. 3. The N3-containing molecules self-associate similarly but over a centre of inversion, Table 1.

Experimental

To a solution of 2-(4-chlorobenzylsulfanyl)-6-chloro-4-(2-methylpropyl)pyrimidine-5-carbonitrile (705 mg, 2 mmol) in ethanol (8 ml), 3-trifluoromethylaniline (0.002 mol) and anhydrous potassium carbonate (322 mg, 2 mmol) were added and the mixture was heated under reflux for 6 h. On cooling the mixture, the solvent was then distilled *in vacuo*, and water (10 ml) was added to the residue. The separated precipitate was filtered, washed with cold water, dried and crystallized from ethanol to yield 591 mg (62%) of the title compound as colourless crystals. *M.pt:* 409–411 K.

Colourless prisms were obtained by slow evaporation of its CHCl₃:EtOH (1:1, 5 ml) solution held at room temperature. ¹H NMR (DMSO-d₆, 500.13 MHz): δ 0.92 (d, 6H, CH₃, J = 7.0 Hz), 2.08–2.12 (m, 1H, CH), 2.62 (d, 2H, CH₂CH, J = 7.0 Hz), 4.24 (s, 2H, CH₂S), 7.10–7.25 (m, 4H, Ar—H), 7.45–7.57 (m, 2H, Ar—H), 7.83–7.85 (m, 1H, Ar—H), 8.0 (s, 1H, Ar—H), 10.01 (s, 1H, NH). ¹³C NMR (DMSO-d₆, 125.76 MHz): δ 21.88 (CH₃CH), 27.68 (CHCH₃), 33.06 (CH₂S), 44.92 (CH₂CH), 87.66 (C-5), 115.02 (CN), 115.65, 121.23, 124.08, 127.23, 128.65, 129.60, 129.75, 129.90, 131.25, 131.86, 137.23, 139.26 (Ar—C & CF₃), 158.90 (C-6), 172.88, 173.28 (C-2 & C-4).

Refinement

Carbon-bound H-atoms were placed in calculated positions [N—H = 0.88 Å and C—H = 0.95 to 1.00 Å, $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5U_{\text{eq}}(\text{N, C})$] and were included in the refinement in the riding model approximation. The sample studied is a non-merohedral twin and a full sphere of reflections was measured. As it was not possible to separate the diffraction spots in two domains, the twin domains were separated using the *TwinRotMat* routine of *PLATON* (Spek, 2009). The minor twin component refined to 47.16 (7)%. Two reflections, *i.e.* (1̄ 1 8 2) and (0 2 4), were omitted owing to poor agreement. The maximum and minimum residual electron density peaks of 1.44 and 0.53 e Å⁻³, respectively, were located 0.51 Å and 0.81 Å from the H13C and F9 atoms, respectively.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
