Received 13 June 2012; accepted 19 June 2012

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.024; wR factor = 0.068; data-to-parameter ratio = 22.6.

The asymmetric unit of the title compound, $\text{C}_{18}\text{H}_{20}\text{N}_2\text{S}_4$, contains one half-molecule, the complete molecule being generated by a twofold rotation axis. The plane through the NCS_2 group [maximum deviation = 0.01 (7) \AA] is orthogonal to the phenyl ring, forming a dihedral angle of 89.4 (3) $^\circ$. The crystal structure is stabilized by intermolecular $\text{C}-\text{H}\cdots\pi$ interactions.

N-Ethyl-N-phenyl{[ethyl(phenyl)carbamothioyl]disulfanyl}carbothioamide

Peter A. Ajibade, Benjamin C. Ejelonu and Bernard Omondi

Comment

Thiuram disulfides are semi-esters of dialkyldithiocarbamic acids (Victoriano, 2000). They are unique among thiolato type ligands in that reductive scission of the S—S bond leads to chelating dithiocarbamate anions which are particularly well suited to stabilize high oxidation state transition metals like dithiocarbamate ligands (Victoriano, 2000). Metal species with closed shell configuration typically react with thiuram disulfides to yield adducts. Some adducts of well defined thiuram complexes have been obtained by the reaction of group 12 halides and the ligands McCleverty & Morrison (1976).

The structure of (I) Fig. 1, consists of two *N*-ethyl-*N*-phenyldithiocarbamate units linked by an S—S bond. The plane of NCS₂ group is orthogonal to the plane of the phenyl ring forming a dihedral angle of 89.40 (3)° between them. The torsion angle between the thiocarbamate moieties (NCS₂) is 79.01 (8)°. The lattice is stabilized by C—H···π intermolecular interactions with a *Cg*···H distance of 3.7972 (14) Å.

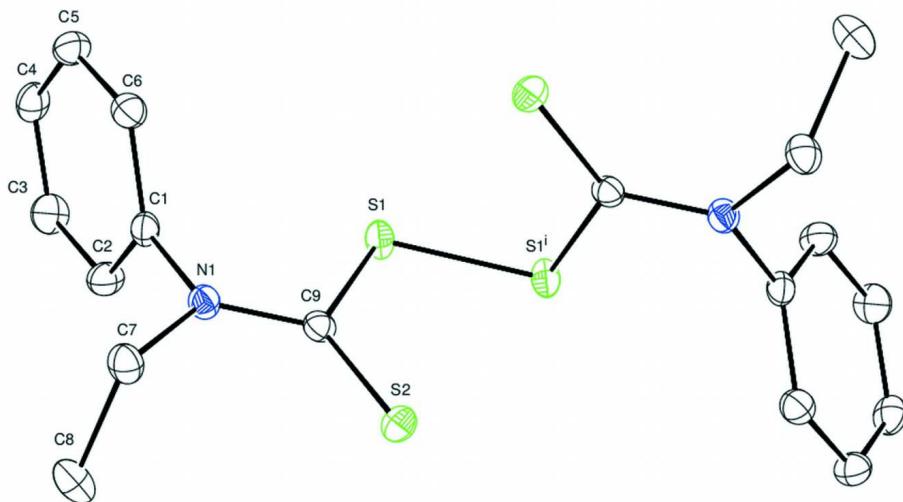

The S—C, S==C and C—N bond distances are comparable to those of related structures (Fun *et al.* 2001; Raya *et al.* 2005).

Experimental

A mixture of 6.44 ml of ethylaniline and 15.00 ml of concentrated aqueous ammonia in ice was added into 3.00 ml of ice-cold carbon disulfide and the resultant solution stirred for 6–7 h. The solid product obtained was filtered and rinsed three times with ice cold ethanol three times. The yellowish white was recrystallized in water/methanol mixture to yield crystal suitable for X-ray crystallographic analysis.

$$\Delta\rho_{\min} = -0.29 \text{ e } \text{\AA}^{-3}$$

Special details

Experimental. Carbon-bound H-atoms were placed in calculated positions [C—H = 0.98 Å for Me H atoms, 0.99 Å for Methylene H atoms and 0.95 Å for aromatic H atoms; $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$] and were included in the refinement in the riding model approximation.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger. The following ALERTS were generated. Each ALERT has the format test-name_ALERT_alert-type_alert-level.
