Structure type: $\mathbf{U}_{3} \mathrm{Si}_{2}$
Tetragonal; $n=2$; space group: $P 4 / m b m-D_{4 n}^{5}$.
$a_{1}=7.3151 \pm 0.0004 \mathrm{kX} ., \quad a_{3}=3.8925 \pm 0.0005 \mathrm{kX}$. $2 \mathrm{U}_{\mathrm{I}}$ in $2(a)$.
$4 \mathrm{U}_{\mathrm{II}}$ in $4(h)$, with $x=0 \cdot 181$.
4 Si in $4(g)$, with $x=0.389$.
$\mathrm{U}_{\mathrm{I}}-4 \mathrm{Si}=2.96$ A., $\mathrm{U}_{\mathrm{I}}-8 \mathrm{U}_{\mathrm{II}}=3.32 \mathrm{~A} .$,
$\mathrm{U}_{\mathrm{II}}-6 \mathrm{Si}=2.92$ A., $\mathrm{U}_{\mathrm{II}}-4 \mathrm{U}_{\mathrm{I}}=3.32$ A.,
$\mathrm{Si}-1 \mathrm{Si}=2 \cdot 30 \mathrm{~A}$.
The structure contains pairs of Si atoms.

## Structure type: $\mathrm{U}_{3} \mathbf{S i}$

Tetragonal; $n=4$; space group: $I 4 / m c m-D_{4 h}^{18}$.
$a_{1}=6.017 \pm 0.002 \mathrm{kX} ., \quad a_{3}=8.679 \pm 0.003 \mathrm{kX}$.
$4 \mathrm{U}_{\mathrm{I}}$ in $4(a)$.
$8 \mathrm{U}_{\mathrm{II}}$ in $8(h)$, with $x=0 \cdot 231$.
4 Si in $4(b)$.
$\mathrm{U}_{\mathrm{I}}-4 \mathrm{Si}=3.01 \mathrm{~A} ., \quad \mathrm{U}_{\mathrm{I}}-8 \mathrm{U}_{\mathrm{II}}=3.04 \mathrm{~A} .$,
$\mathrm{U}_{\mathrm{II}}-2 \mathrm{Si}=2.92 \mathrm{~A} ., \quad \mathrm{U}_{\mathrm{II}}-2 \mathrm{Si}=3.17 \mathrm{~A}$.,
$\mathrm{U}_{\mathrm{II}}-4 \mathrm{U}_{\mathrm{II}}=3.02 \mathrm{~A}$., $\quad \mathrm{U}_{\mathrm{II}}-4 \mathrm{U}_{\mathrm{I}}=3.04 \mathrm{~A}$.
The structure is closely related to that of $\mathrm{AuCu}_{3}$.
Structure type: $\alpha-\mathrm{UO}_{3}$
Hexagonal; $n=1$; space group: $C \overline{3} m-D_{3 d}^{3}$.
$a_{1}=3.963 \pm 0.004 \mathrm{kX} ., \quad a_{3}=4.160 \pm 0.008 \mathrm{kX}$. 1 U in $1(a)$.
$1 \mathrm{O}_{\mathrm{I}}$ in $\mathrm{l}(b)$.
$2 \mathrm{O}_{\mathrm{II}}$ in $2(\mathrm{~d})$, with $z=0 \cdot 17$.
$\mathrm{U}-2 \mathrm{O}_{\mathrm{I}}=2.08 \mathrm{~A} ., \quad \mathrm{U}-6 \mathrm{O}_{\mathrm{II}}=2 \cdot 39 \mathrm{~A}$.
There are endless chains $-\mathrm{O}_{\mathrm{I}}-\mathrm{U}-\mathrm{O}_{\mathrm{I}}-\mathrm{U}$ - along $a_{3}$.
The orthorhombic $\mathrm{U}_{3} \mathrm{O}_{8}$ structure is closely related.

## Remarks

The compounds of actinium, neptunium, plutonium and americium referred to in this paper were first prepared by various investigators as follows:

Sherman Fried and F. Hagemann: $\mathrm{AcCl}_{3}, \mathrm{AcBr}_{3}$, $\mathrm{Ac}_{2} \mathrm{~S}_{3}$.

Sherman Fried: $\mathrm{AmCl}_{3}, \alpha-\mathrm{NpBr}_{3}, \mathrm{AmBr}_{3}, \mathrm{NpI}_{3}$, $\mathrm{AmI}_{3}, \mathrm{Am}_{2} \mathrm{~S}_{3}$.

Sherman Fried and N. R. Davidson: $\mathrm{NpCl}_{3}$.
I. Sheft: $\beta-\mathrm{NpBr}_{3}$.
F. Hagemann: $\mathrm{PuCl}_{3}, \mathrm{PuI}_{3}$.
N. R. Davidson: $\mathrm{Pu}_{2} \mathrm{O}_{2} \mathrm{~S}, \mathrm{Pu}_{2} \mathrm{~S}_{3}$.
E. K. Hyde: $\mathrm{PuBr}_{3}$.
H. L. Baumbach: $\mathrm{NaPuF}_{4}$.

With the single exception of $\mathrm{PuBr}_{3}$ all of the compounds listed above were first identified by the writer through interpretation of the X-ray diffraction patterns.

Miss Anne Plettinger gave valuable aid by taking all of the powder diffraction patterns.

# Crystal Chemical Studies of the $5 \mathbf{f}$-Series of Elements. II. The Crystal Structure of $\mathbf{C s}_{2} \mathrm{PuCl}_{6}$ 

By W. H. Zachariasen<br>Argonne National Laboratory and the Department of Physics, University of Chicago, Illinois, U.S.A.

(Received 22 July 1948)
$\mathrm{Cs}_{2} \mathrm{PuCl}_{6}$ is trigonal and has the $\mathrm{K}_{2} \mathrm{GeF}_{6}$-type of structure. The unit-cell dimensions are:

$$
a_{1}=7.43 \pm 0.01 \mathrm{kX} ., \quad a_{3}=6.03 \pm 0.01 \mathrm{kX}
$$

giving a calculated density of $\rho=4 \cdot 10 \mathrm{~g} \cdot \mathrm{~cm} .^{-3}$ Plutonium is bonded to six chlorine atoms at the corners of an octahedron with $\mathrm{Pu}-\mathrm{Cl}=2.62 \mathrm{~A}$. Cesium is bonded to twelve chlorine atoms with $\mathrm{Cs}-\mathrm{Cl}=3.71 \mathrm{~A}$.

The compound $\mathrm{Cs}_{2} \mathrm{PuCl}_{6}$ was first prepared by Herbert H. Anderson,* who also established the identity of the substance by direct chemical analysis. The results given below were obtained using a micro-sample of the original preparation kindly lent to the writer by Dr Anderson.

The sample consisted of a small amount of powdered material in a sealed, thin-walled glass capillary. The powder diffraction photographs were taken with $\mathrm{Cu} K$ radiation filtered through nickel foil.

[^0]Table 1 gives a portion of the diffraction data (up to $\sin ^{2} \theta=0.310$ ). The observed sine squares correspond to a hexagonal unit cell with dimensions

$$
a_{1}=7.43 \pm 0.01 \mathrm{kX} ., \quad a_{3}=6.03 \pm 0.01 \mathrm{kX}
$$

In this cell there is room for but one molecule $\mathrm{Cs}_{2} \mathrm{PuCl}_{6}$, giving a calculated density $\rho=4 \cdot 10$ g. $\mathrm{cm} .^{-3}$.

Reflections $H_{1} H_{2} 0$ are missing if $H_{1}-H_{2}=3 n \pm 1$. Reflections $H_{1} H_{2} H_{3}$ for which $H_{1}-H_{2}=3 n$ are strong when $H_{3}=0$ or 4 , weak when $H_{3}=1$ or 3 , and missing when $H_{3}=2$. These observations require the cesium positions to be $\pm\left(\frac{2}{3}, \frac{1}{3}, u\right)$ with $u \approx \frac{1}{4}$.

The calculated intensities due to the metal atoms alone explain the main features of the observed intensity distribution. There are, however, a series of discrepancies which must be ascribed to the effect of the chlorine atoms. The most symmetrical space group compatible with the deduced metal positions is $C \overline{3} m-D_{3 d}^{3}$. An attempt was therefore made to remove the discrepancies by placing the chlorine atoms in accordance with the space group symmetry $C \overline{3} m$.

Table 1. Diffraction data for $\mathrm{Cs}_{2} \mathrm{PuCl}_{6}$

| $\sin ^{2} \theta$ | $I$ | $H_{1} H_{2} H_{3}$ | $\sin ^{2} \theta$ | $I$ | $H_{1} H_{2} H_{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0.0169 | $w m^{*}$ | 001 | $0 \cdot 1678$ | $m$ | 212 |
| 0.0315 | $s$ | 101 | $0 \cdot 1732$ | $w+$ | 220 |
| 0.0437 | $m$ | 110 | $0 \cdot 1919$ | $m$ | $221+113$ |
| 0.0604 | vw | 111 | 0.2058 | $s$ | $311+203$ |
| 0.0670 | $v w$ | 002 | $0 \cdot 2476$ | $w$ | $213+401$ |
| 0.0750 | $s$ | 201 | $0 \cdot 2524$ | $w$ | 312 |
| $0 \cdot 0815$ | $s$ | 102 | $0 \cdot 2636$ | $m$ - | 004 |
| $0 \cdot 1179$ | $m$ - | 211 | $0 \cdot 2778$ | $m$ | $104+303$ |
| $0 \cdot 1244$ | $m+$ | 202 | $0 \cdot 2898$ | $v w$ | 321 |
| $0 \cdot 1307$ | vw | 300 | $0 \cdot 2963$ | $v w+$ | 402 |
| $0 \cdot 1484$ | vo | $301+003$ | $0 \cdot 3026$ | vow | 410 |
| $0 \cdot 1632$ | $w-$ | 103 | $0 \cdot 3066$ | $m$ | 114 |

This attempt led to the following structure:
1 Pu in $(0,0,0)$;
2 Cs in $\pm\left(\frac{2}{3}, \frac{1}{3}, u\right)$ with $u=0.25 \pm 0.03$;
6 Cl in $\pm(x, \bar{x}, z)(x, 2 x, z)(2 \bar{x}, \bar{x}, z)$ with $x=0 \cdot 17 \pm 0 \cdot 03$ and $z=0.25 \pm 0.04$.

Since only powder photographs were available reflections $H_{1} H_{2} H_{3}$ and $H_{2} H_{1} H_{3}$ could not be separated. Hence, the parameter values could not be determined with accuracy.

Table 2 shows a comparison of observed and calculated intensities. The latter were calculated by the formula

$$
I \propto|F|^{2} p \frac{1+\cos ^{2} 2 \theta}{\sin ^{2} \theta \cos \theta}
$$

where $p$ is the permutation factor. It is seen that the agreement in Table 2 is fairly satisfactory except that the reflections $H_{1} H_{2} H_{3}$ appear with enhanced intensity when $H_{3}^{2} /\left(H_{1}^{2}+H_{1} H_{2}+H_{2}^{2}\right)$ is large. This enhancement would result if the crystallites were tabular parallel to ( 001 ). Because of the extremely high
absorption coefficient only the crystallites near the inner wall of the capillary would contribute to the scattering. These crystallites would, because of their tabular shape, tend to line up parallel to the glass wall and thus give rise to the observed enhancement.

The deduced structure is of the $\mathrm{K}_{2} \mathrm{GeF}_{6}$-type (Hoard \& Vincent, 1939). Each plutonium atom is bonded to six chlorine atoms at the corners of a nearly perfect octahedron. The interatomic distance is $\mathrm{Pu}-\mathrm{Cl}=2.62 \mathrm{~A}$.

Table 2. Observed and calculated intensities

|  | Intensity |  | $H_{1} H_{2} H_{3}$ | Intensity |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $H_{1} H_{2} H_{3}$ | Calc. | Obs. |  | Calc. | Obs. |
| 100 | $0 \cdot 6$ | Nil | 103 | $1 \cdot 6$ | $w-$ |
| 001 | $3 \cdot 5$ | $w m^{*}$ | 212 | $4 \cdot 0$ | $m$ |
| 101 | $14 \cdot 3$ | $s$ | 220 | $4 \cdot 1$ | $w+$ |
| 110 | $10 \cdot 6$ | $m$ | 310 | $0 \cdot 3$ | Nil |
| 200 | $0 \cdot 1$ | Nil | 221 | $0 \cdot 81$ | $m$ |
| 111 | $4 \cdot 2$ | vw | 113 | $0 \cdot 8)$ | $m$ |
| 002 | $0 \cdot 8$ | $v w$ | 302 | 0 | Nil |
| 201 | $12 \cdot 6$ | $s$ | 311 | $3 \cdot 6$ | $s$ |
| 102 | $5 \cdot 7$ | $s$ - | 203 | $2 \cdot 8$ | $s$ |
| 210 | $0 \cdot 7$ | Nil | 400 | 0 | Nil |
| 112 | $0 \cdot 1$ | Nil | 222 | $0 \cdot 4$ | Nil |
| 211 | $5 \cdot 2$ | $m$ - | 401 | $1.9\}$ | $v$ |
| 202 | $6 \cdot 1$ | $m+$ | 213 | $1 \cdot 6\}$ | $w$ |
| 300 | $2 \cdot 4$ | vw | 312 | 1.9 | $w$ |
| 301 | $1 \cdot 2$ |  | 004 | $0 \cdot 6$ | $m$ - |
| 003 | $0 \cdot 2$ | vw |  |  |  |

Each cesium atom is bonded to twelve chlorine atoms, six of them at a distance $\mathrm{Cs}-\mathrm{Cl}=3.70 \mathrm{~A}$., and six at $\mathrm{Cs}-\mathrm{Cl}=3.72 \mathrm{~A}$.

The interionic distances calculated with the aid of the ionic radii of the writer (Zachariasen, 1931, 1948) are $\mathrm{Pu}^{+4}-\mathrm{Cl}^{-}=2.67 \mathrm{~A}$. and $\mathrm{Cs}^{+}-\mathrm{Cl}^{-}=3.74 \mathrm{~A}$., in satisfactory agreement with the observed values.

The writer wishes to express his gratitude to Dr Herbert H. Anderson for the loan of the microsample and to Miss Anne Plettinger for having taken the powder photograph.
