# The Crystal Structure of Mercuric Sulphate Monohydrate 

By A. Bonefačić<br>Rudjer Bošković Institute and Physical Institute of the Faculty of Science, University, Zagreb, Yugoslavia

(Received 31 December 1959 and in revised form 14 March 1960)

#### Abstract

The structure of mercuric sulphate monohydrate has been determined by X-ray analysis. It is orthorhombic with the space group $D_{2 h}^{16}-P m e n$. The unit cell of dimensions $$
a=5 \cdot 42, b=8.94, c=7.82 \AA
$$ contains four formula units. The parameters of the atoms were determined with the help of Patterson and Fourier-Bragg projections. Each mercury atom is surrounded by five oxygen atoms and a water molecule in octahedral coordination.

## Introduction

A number of authors have worked on the mercuric sulphates. Hoitsema (1895) has listed the following compounds:

$$
\underset{\substack{\mathrm{HgSO}_{4} \\ \text { and } 2 \mathrm{HgO}, \mathrm{HgSO}_{4}}}{2 \mathrm{HgSO}_{4} . \mathrm{HgO}_{2} \mathrm{O}, \mathrm{HgSO}_{4} . \mathrm{H}_{2} \mathrm{O}}
$$

Some authors did not agree completely with Hoitsema's results, but they were confirmed by Paić (1933), who used X-ray powder diagrams. The same author studied also the dehydratation of mercuric sulphate hydrates.

With the intention of finding out the role of a water molecule in these sulphates, we started our work on the crystal structures of the compounds mentioned above. In the present article the result of the crystal analysis of $\mathrm{HgSO}_{4} . \mathrm{H}_{2} \mathrm{O}$ is reported. Work on the structures of the remaining sulphates is in progress.

## Experimental

Well-formed, colourless, transparent single crystals were prepared by slow evaporation of a solution of mercuric sulphate in dilute sulphuric acid. The crystals obtained were orthorhombic and had already been described and examined crystallographically by Hoitsema (1895).

All X-ray diffraction data were obtained from oscillation and Weissenberg diagrams taken with nickel-filtered $\mathrm{Cu} K$ radiation. The diagrams gave

$$
a=5 \cdot 42 \pm 0 \cdot 01, b=8 \cdot 94 \pm 0 \cdot 02, c=7 \cdot 82 \pm 0 \cdot 02 \AA .
$$

The pycnometrically measured density of the crystals was $5 \cdot 52 \mathrm{~g} . \mathrm{cm} .^{-3}$; that calculated with four formula units in the elementary cell is $5 \cdot 36 \mathrm{~g} . \mathrm{cm} .^{-3}$.
The observed reflexions are: $h k 1$ : no conditions, $h k 0: h+k=2 n, 0 k l:$ no conditions, $h 0 l: l=2 \mathrm{n}$. It thus follows, taking also into account the holohedral appearance of the crystals, that $D_{2 h}^{16}-P m c n$ is the most probable space group.

Multiple-film Weissenberg diagrams were used to obtain intensity data for $0 k 1$ and $h k 0$ reflexions. The relative intensities were determined from the optical densities measured at the centre of each spot by means of a microdensitometer. In order to facilitate the absorption correction, the specimen was made cylindrical by grinding. The linear absorption coefficient was $825 \mathrm{~cm} .^{-1}$. Corrections for Lorentz and polarization factors were made in the usual way.

## Determination of the structure

There are for the space group Pmon eightfold general positions and, since the unit cell contains four formula units, the mercury, sulphur and oxygen (from a water molecule) atoms must occupy special positions. Because of the absence of the extra conditions of extinctions for $h k l$ reflexions it follows that these atoms lie in the plane of symmetry $m$ at $\frac{1}{4}$ and $\frac{3}{4}$ of a period $a$.

The parameters of the mercury atom were obtained from [100] and [001] Patterson projections. The contour map of the Patterson projection on (100) is given in (Fig. 1(a)). For the first Fourier synthesis the signs of the structure factors $F(0 k l)$ and $F(h k 0)$ were determined using only mercury-atom contributions. Later the signs were recalculated taking also the sulphur-atom contributions into account. Only five structure factors changed sign owing to the inclusion of the sulphur atom. The maxima of all atoms (except the hydrogen atom) are well resolved. In both projections the diffraction rings around the mercury atoms influenced appreciably the position of the maximum

Table 1. Atomic parameters in $\mathrm{HgSO}_{4} . \mathrm{H}_{2} \mathrm{O}$

| Atom | $x$ | $y$ | $z$ |
| :--- | :---: | :---: | ---: |
| 4 Hg |  | $y$ | 0.133 |
| 4 S | $-\frac{1}{4}$ | 0.208 | 0.145 |
| $4 \mathrm{O}(\mathrm{I})$ | $-\frac{1}{4}$ | 0.087 | 0.094 |
| $8 \mathrm{O}(\mathrm{II})$ | -0.017 | 0.241 | -0.116 |
| $4 \mathrm{O}(\mathrm{III})$ | - | 0.019 | -0.228 |
| $4 \mathrm{O}\left(\mathrm{H}_{2} \mathrm{O}\right)$ | 4 | 0.470 | 0.130 |

Fig. 1. (a) The contour map of the Patterson projection on (100). (b) Fourier projection on (100). By the mercury atom peak each seventh line is drawn. (c) Fourier projection on (001). By the mercury atom peak each third line is drawn. The contours are at arbitrary intervals.
of the oxygen atom which fell near the mercury atom. These peaks appeared also distorted and lengthened (Fig. $\mathbf{l}(b)$ and ( $c$ )).

Subtracting the contributions of mercury and sulphur atoms to each reflexion, we could readjust somewhat the positions of the oxygen atoms. The final atomic coordinates are given in Table 1 and the comparison between $F_{o}$ and $F_{c}$ is given in Table 2.

The parameter $B$ of the temperature factor was determined from calculated and observed structure amplitudes, the straight line being determined by the least-squares method. We found by this procedure $B=2.35 \AA^{2}$ for the projection along [100] and $B=$ $2 \cdot 70 \AA^{2}$ for the projection along [001]. The reliability index $R=\Sigma| | F_{o}\left|-\left|F_{c}\right|\right| / \Sigma\left|F_{o}\right|$ has the values 0.18 and $0 \cdot 15$ for $F(0 k l)$ and $F(h k 0)$ respectively.

## Description and discussion of the structure

The mercury atom lies at the centre of a distorted octahedron of five oxygen atoms from a sulphate ion and an oxygen atom from a water molecule.

In the [001] direction the coordination octahedra are arrayed in zigzag chains by sharing one edge (Fig. 2). This common edge of two linked octahedra is the shortest $0-0$ distance in the octahedron. Neighbouring chains of octahedra are connected through $\mathrm{SO}_{4}$ groups, one connection along [100] by $O(I I)$, the other one by $O(I I)$ and $O(I I I)$. The $O(I)$ atom is included in the sulphate tetrahedra only. This oxygen atom is nearer to sulphur ( $1.24 \AA$ ) than the other atoms of oxygen in the sulphate ion.

in the unit cell, calculated with the values of parameters listed in Table 1, are given in Table 3.

Table 3. Interatomic distances in $\mathrm{HgSO}_{4} . \mathrm{H}_{2} \mathrm{O}$

| Atom | Neighbour | Coordination number | Interatomic distances |
| :---: | :---: | :---: | :---: |
| Hg | O (II) | 2 | $2 \cdot 44 \AA$ |
|  | O (II) | 2 | $2 \cdot 47$ |
|  | $\mathrm{O}(\mathrm{III})$ | 1 | $2 \cdot 10$ |
|  | $\mathrm{O}\left(\mathrm{H}_{2} \mathrm{O}\right)$ | 1 | $2 \cdot 34$ |
| S | O (I) | 1 | 1.24 |
|  | $\mathrm{O}(\mathrm{II})$ | 2 | 1.53 |
|  | O (III) | 1 | 1.53 |
|  | O-O distances in tetrahedron |  |  |
| O(I) | O(II) | - | 1.95 |
|  | O (III) | - | $2 \cdot 24$ |
| O(II) | O (II) | - | 2.53 |
|  | O(III) | - | 2.51 |
|  | $\mathrm{O}-\mathrm{O}$ distances in octahedron |  |  |
| O(II) | O (II) | - | 3.91 |
|  | $\mathrm{O}(\mathrm{II})$ | - | $2 \cdot 89$ |
|  | $\mathrm{O}\left(\mathrm{H}_{2} \mathrm{O}\right)$ | - | $3 \cdot 09$ |
|  | $\mathrm{O}\left(\mathrm{H}_{2} \mathrm{O}\right)$ | - | 3.18 |
|  | O (III) | - | $3 \cdot 85$ |
|  | O (III) | - | $3 \cdot 14$ |

The values for the distances from mercury to the sulphate-oxygen atoms O (II) ( $2 \cdot 44$ and $2.47 \AA$ ) are nearly equal to the sum of ionic radii ( $2 \cdot 45 \AA$ ), if the values of $1 \cdot 10 \AA$, the generally accepted value for the radius of the mercuric ion, and $1.35 \AA$ for oxygen are
used. Distances of nearly the same length ( 2.40 and $2 \cdot 42 \AA$ ) are found to exist also in crystals of mercurous nitrate dihydrate, between mercury and the nitrateoxygen atoms (Grdenić, 1956).

Shorter distances between the mercury atom and the water molecule ( $2 \cdot 34 \AA$ ) are found. It may be compared with the distances between the mercury atom and the water molecule in mercurous nitrate dihydrate ( $2 \cdot 15 \AA$ ). A short coordination $\mathrm{Hg}-\mathrm{O}$ bond has been shown to exist also in mercury diethylene oxide ( $2 \cdot 21 \AA$ ) by Grdenić (1952), and much shorter ( $2 \cdot 03 \AA$ ) in trichlormercury oxonium chloride (Śćavničar \& Grdenić, 1955) and in mercuric oxide (Aurivilius, 1954).

The author wishes to thank Prof. M. Paić (Physical Institute, Faculty of Science, Zagreb) for suggesting the work and for his interest. Thanks are due to Prof. D. Grdenic (Laboratory of General and Inorganic Chemistry, Faculty of Science, Zagreb) and to the members of the Department of Structural and Inorganic Chemistry, Institute Rudjer Bošković, Zagreb, for discussions and reading the manuscript.

# The Crystal Structure of $\mathbf{U R e}_{2}$ 

By B. A. Hatt<br>Physics Laboratory, Fulmer Research Institute Ltd., Stoke Poges, Buckinghamshire, England

(Received 4 April 1960)
The intermetallic compound $\mathrm{URe}_{2}$ has two allotropic forms. Up to $180^{\circ} \mathrm{C}$. it has an orthorhombic structure, space group Cmca; above this temperature a C14 structure is formed by a simple dilation of the unit cell. The lattice parameters at $20^{\circ} \mathrm{C}$. are

$$
a=5 \cdot 600, b=9 \cdot 180, c=8 \cdot 460 \AA .
$$

For the hexagonal modification at $213^{\circ} \mathrm{C} . a=5 \cdot 433, c=8.561 \AA$. In both modifications the thermal expansion coefficients are positive along $c$ and negative along $a$.

## Introduction

During an investigation of the uranium-rhenium phase diagram an intermetallic compound $\mathrm{URe}_{2}$ was observed (Brook \& Hatt, 1954). An alloy of composition uranium $66.7 \mathrm{at} . \%$ rhenium appeared single-phased when examined microscopically and by the X-ray Debye-Scherrer powder method, whereas alloys with
higher rhenium content showed free rhenium, and those of lower rhenium content free uranium. Spacing measurements indicated a negligible solubility of either rhenium or uranium in URe 2 .

## Structure determination

Alloys of $\mathrm{URe}_{2}$ were prepared from uranium bar
