# The Bond Lengths in the Sodium Metaborate Structure 

By M. Marezio, H. A. Plettinger and W. H. Zachariasen<br>Department of Physics, University of Chicago and Argonne National Laboratory, U.S.A.

(Received 2 October 1962)

#### Abstract

The position parameters of the sodium metaborate structure have been redetermined. Each boron atom is bonded to one $O_{I}$ atom with a bond length of $1 \cdot 280 \pm 0.016 \AA$ and to two $\mathrm{O}_{\text {II }}$ atoms with $\mathrm{B}-\mathrm{O}_{\text {II }} \mathrm{I} .433 \pm 0.009 \AA$, while each sodium atom forms bonds with five $\mathrm{O}_{\mathrm{I}}$ atoms and two $\mathrm{O}_{\text {II }}$ atoms, the $\mathrm{Na}-\mathrm{O}$ distance ranging from $2 \cdot 461 \AA$ to $2 \cdot 607 \AA$.

As previously found, the structure contains plane groups $\left(\mathrm{B}_{3} \mathrm{O}_{6}\right)^{-3}$ composed of three $\mathrm{BO}_{3}$-triangles with two of three corners shared.

The large difference in the $\mathrm{B}-\mathrm{O}$ bond lengths is attributed to an unequal distribution of the boron valence strength between the three bonds. Perfect valence balance requires a strength of 1.32 for the $\mathrm{B}-\mathrm{O}_{\mathrm{I}}$ bond and 0.84 for the $\mathrm{B}-\mathrm{O}_{\text {II }}$ bond.

The early crystal structure studies of potassium metaborate (Zachariasen, 1937) and of the isomorphous sodium metaborate (Fang, 1938) established the existence of the group $\left(\mathrm{B}_{3} \mathrm{O}_{6}\right)^{-3}$ in the form of a plane ring of three $\mathrm{BO}_{3}$-triangles.

The structure data reported for the sodium compound were:

|  | Rhombohedral | Hexagonal |
| :---: | :---: | :---: |
| Space group | $R \overline{3} c$ |  |
| Dimensions | $\begin{aligned} a & =7 \cdot 22 \pm 0.01 \mathrm{kX} \\ \alpha & =111^{\circ} \frac{2}{29^{\prime}} \end{aligned}$ | $\begin{aligned} & a=11.91 \pm 0.02 \mathrm{kX} \\ & c=6.45 \pm 0.01 \mathrm{kX} \end{aligned}$ |
| $N$ | 6 | 18 |
| All atoms in positions | $6 e$ | $18 e$ |
| Parameter values | $X_{r}$ | $X_{h}=X_{r}-\frac{1}{4}$ |
| Na | $0.696 \pm 0.003$ | 0.446 |
| B | $0 \cdot 362 \pm 0.006$ | $0 \cdot 112$ |
| $\mathrm{O}_{\text {I }}$ | $0.479 \pm 0.006$ | $0 \cdot 229$ |
| $\mathrm{O}_{\text {II }}$ | $0 \cdot 138 \pm 0.006$ | -0.112 |

Each $\mathrm{O}_{\mathrm{I}}$ atom is bonded to five sodium and one boron atom, each $\mathrm{O}_{\text {II }}$ atom to two sodium and two boron atoms. Accordingly one oxygen atom is 'underbonded' and the other 'overbonded', and one would expect this imbalance in the bonding to result in appreciably different bond lengths for the two sets of oxygen atoms. However, the work of a quarter of a century ago was not sufficiently precise to detect such differences.

As part of the systematic studies of borate structures being carried out in this laboratory a redetermination has been made of the position parameters for $\mathrm{NaBO}_{2}$, using new intensity data measured with a counter spectrometer.
The revised values for the cell dimensions are:
Hexagonal cell:

$$
a=11.925 \pm 0.001, c=6.439 \pm 0.001 \AA .
$$

Rhombohedral cell:

$$
a=7.212 \AA, \alpha=111.54^{\circ} .
$$

In the following the hexagonal cell will be used.
Because there are no position parameters in the $Z$-direction, intensities were measured only for reflections ( $H K 0$ ) and ( $H K 1$ ) (using $\mathrm{Cu} K \alpha$ radiation). The parameter refinement was carried out with the Busing-Levi IBM-704 program. The $f$-curve of McWeeny (1951) was assumed for boron, those of Berghuis et al. (1955) for sodium and oxygen. The 1938 parameters were used as starting values. Because of the incompleteness of the experimental data, the temperature factors were taken to be isotropic. A small secondary extinction correction was applied in the last refinement stage.

The least-square refinement, based on 53 reflections, gave a conventional $R$-factor (including zeros) of 0.067 and the parameter values listed in Table 1.

Table 1. Position and thermal parameters for $\mathrm{NaBO}_{2}$

|  | $X$ | $B$ |
| :--- | ---: | :--- |
| Na | $0 \cdot 4371 \pm 0.0004$ | $1 \cdot 77 \pm 0 \cdot 13 \AA^{2}$ |
| B | $0.1234 \pm 0.0012$ | $2 \cdot 24 \pm 0.31$ |
| $\mathrm{O}_{\mathrm{I}}$ | $0.2307 \pm 0.0006$ | $1.77 \pm 0.19$ |
| $\mathrm{O}_{\mathrm{II}}$ | $-0.1167 \pm 0.0006$ | $1 \cdot 68 \pm 0.20$ |

(The hexagonal, $X_{h}$, and the rhombohedral position parameters, $X_{r}$, are simply related: $X_{r}=X_{h}+\frac{1}{4}$.) Table 2 gives the calculated and observed structure factors.

The interatomic distances calculated with the parameters of Table 1 are as follows:

| B $-1 \mathrm{O}_{\text {I }}$ | $1 \cdot 280 \pm 0.016 \AA$ | $\mathrm{Na}-1 \mathrm{O}_{\text {I }}$ | $2 \cdot 461 \pm 0.009 \AA$ |
| :--- | :--- | :--- | :--- |
| B $-2 \mathrm{O}_{\text {II }}$ | $1 \cdot 433 \pm 0.009$ | $\mathrm{Na}-2 \mathrm{O}_{\text {I }}$ | $2 \cdot 474 \pm 0.002$ |
| $\mathrm{O}_{\text {I }}-2 \mathrm{O}_{\text {II }}$ | $2 \cdot 383 \pm 0.006$ | $\mathrm{Na}-2 \mathrm{O}_{\text {I }}$ | $2 \cdot 607 \pm 0.004$ |
| O $_{\text {II }}-1 \mathrm{O}_{\text {II }}$ | $2 \cdot 410 \pm 0.013$ | $\mathrm{Na}-2 \mathrm{O}_{\text {II }}$ | $2 \cdot 482 \pm 0.006$ |

Table 2. Observed and calculated structure factors

| $H K L$ | $F_{o}$ | $0 \cdot 533 F_{c}$ | $H K L$ | $F_{o}$ | $0 \cdot 533 F_{c}$ |
| ---: | ---: | ---: | ---: | ---: | ---: |
| 110 | $4 \cdot 4$ | $3 \cdot 8$ | 511 | $44 \cdot 7$ | $-45 \cdot 9$ |
| 300 | $5 \cdot 7$ | $5 \cdot 4$ | 431 | $30 \cdot 2$ | $29 \cdot 7$ |
| 220 | $5 \cdot 8$ | $-6 \cdot 1$ | 161 | $7 \cdot 7$ | $-7 \cdot 3$ |
| 410 | $12 \cdot 9$ | $-12 \cdot 8$ | 351 | $30 \cdot 7$ | $-29 \cdot 7$ |
| 330 | $82 \cdot 2$ | $-81 \cdot 2$ | 621 | $10 \cdot 0$ | $10 \cdot 6$ |
| 600 | $5 \cdot 4$ | $-5 \cdot 0$ | 541 | $3 \cdot 7$ | $-3 \cdot 4$ |
| 520 | $18 \cdot 7$ | $20 \cdot 8$ | 271 | $5 \cdot 9$ | $5 \cdot 4$ |
| 440 | $10 \cdot 7$ | $-9 \cdot 3$ | 811 | $7 \cdot 7$ | $-8 \cdot 1$ |
| 710 | $12 \cdot 4$ | $12 \cdot 1$ | 461 | $30 \cdot 4$ | $29 \cdot 5$ |
| 630 | $3 \cdot 6$ | $-3 \cdot 7$ | 731 | $6 \cdot 5$ | $6 \cdot 6$ |
| 550 | $6 \cdot 7$ | $-6 \cdot 8$ | 651 | $26 \cdot 3$ | $-27 \cdot 0$ |
| 900 | $70 \cdot 7$ | $76 \cdot 9$ | 191 | $4 \cdot 5$ | $4 \cdot 2$ |
| 820 | $1 \cdot 5$ | $-2 \cdot 4$ | 381 | $12 \cdot 6$ | $-12 \cdot 6$ |
| 740 | $n i l$ | $0 \cdot 9$ | 921 | $3 \cdot 2$ | $-3 \cdot 8$ |
| 660 | $30 \cdot 7$ | $-28 \cdot 8$ | 571 | $14 \cdot 8$ | $-12 \cdot 9$ |
| $10,1,0$ | $10 \cdot 4$ | $-10 \cdot 8$ | 841 | $15 \cdot 1$ | $14 \cdot 4$ |
| 930 | $3 \cdot 1$ | $3 \cdot 0$ | $2,10,1$ | $2 \cdot 2$ | $-0 \cdot 9$ |
| 850 | $4 \cdot 9$ | $-4 \cdot 0$ | 761 | $8 \cdot 4$ | $-8 \cdot 5$ |
| $12,0,0$ | $6 \cdot 5$ | $6 \cdot 6$ | 491 | $3 \cdot 8$ | $2 \cdot 8$ |
| $11,2,0$ | $7 \cdot 4$ | $-6 \cdot 3$ | $11,1,1$ | $3 \cdot 9$ | $4 \cdot 8$ |
| 770 | $15 \cdot 2$ | $14 \cdot 1$ | $10,3,1$ | $17 \cdot 5$ | $-15 \cdot 0$ |
| $10,4,0$ | $7 \cdot 0$ | $-3 \cdot 6$ | 681 | $13 \cdot 0$ | $9 \cdot 9$ |
| 960 | $1 \cdot 7$ | $-1 \cdot 8$ | 951 | $n i l$ | $-0 \cdot 1$ |
| 211 | $3 \cdot 1$ | $-1 \cdot 3$ | $1,12,1$ | $12 \cdot 6$ | $-11 \cdot 0$ |
| 131 | $55 \cdot 6$ | $-57 \cdot 1$ | $3,11,1$ | $15 \cdot 2$ | $13 \cdot 4$ |
| 321 | $61 \cdot 0$ | $57 \cdot 9$ | 871 | $n i l$ | $0 \cdot 5$ |
| 241 | $50 \cdot 3$ | $48 \cdot 3$ |  |  |  |

The $\mathrm{B}-\mathrm{O}_{\mathrm{I}}$ distance of $1.280 \AA$ is the smallest, and the $\mathrm{B}-\mathrm{O}_{\text {II }}$ distances of $1.433 \AA$ are the largest values ever observed for the triangular boron-oxygen bond. The extreme values for the tetrahedral B-O bond length are 1.433 and $1.553 \AA$, and were found in $\beta-\mathrm{HBO}_{2}$ (Zachariasen, 1963).
Were the valence strength of one for sodium equally distributed between the seven $\mathrm{Na}-\mathrm{O}$ bonds, and were the valence strength of three for boron equally divided between the three $\mathrm{B}-\mathrm{O}$ bonds, then the total bond strength for $\mathrm{O}_{\mathrm{I}}$ would be 1.71 and for $\mathrm{O}_{\text {II }} 2 \cdot 29$, giving rise to a pronounced imbalance in the bond strength distribution. This great imbalance is in large measure removed by shortening (and hence strengthening) of the $\mathrm{B}-\mathrm{O}_{\mathrm{I}}$ bonds and a corresponding weakening of the $\mathrm{B}-\mathrm{O}_{\text {II }}$ bonds.

It is reasonable to assume for small bond strengths that the bond length decreases linearly as the bond strength increases. However, because of the strong repulsive forces, it is to be expected that a slower decrease in bond length with increasing bond strength
will occur at greater bond strength. One consequence of this departure from linearity between length and strength is that the mean interatomic distance will not be constant, but will increase with increasing fluctuations of individual bond distances from the mean. In $\mathrm{NaBO}_{2}$ the mean B-O distance of $1.382 \AA$ is appreciably higher than observed in other structures ( $1 \cdot 365 \AA$ ) with smaller differences between individual bond lengths. Thus it is strongly indicated that there is appreciable departure from linearity between length and strength for the B-O bond at strengths above unity.

The mean length of the seven $\mathrm{Na}-\mathrm{O}$ bonds is $2.512 \AA$. This should be compared with the value $2 \cdot 45 \AA$ usually observed for the $\mathrm{Na}-\mathrm{O}$ bond when the coordination number is six. Accordingly one can, without appreciable error, assign a strength $s=0.10$ to the long $\mathrm{Na}-\mathrm{O}$ bond of $2.607 \AA$ and a strength $s=0.16$ to each of the other $\mathrm{Na}-\mathrm{O}$ bonds.

In order to achieve detailed balance of valences the $\mathrm{B}-\mathrm{O}_{\mathrm{I}}$ bond of $\mathrm{I} \cdot 280 \AA$ must be ascribed a strength $s=1 \cdot 32$ and each bond $\mathrm{B}-\mathrm{O}_{\mathrm{II}}$ of length $1 \cdot 433 \AA \mathrm{a}$ strength $s=0.84$.

These results and the results from a number of other precisely determined borate structures were used to construct the empirical bond strength versus bond length relationship for the B-O bond reported in a recent article (Zachariasen, 1963).
Because only reflections $H K 0$ and $H K 1$ were used in the refinement, the $B$-values given in Table 1 will correspond to thermal vibrations essentially parallel to the plane of the $\left(\mathrm{B}_{3} \mathrm{O}_{6}\right)^{-3}$ group.

We are indebted to the staff of IBM-704 Computer at Argonne National Laboratory for help with the least-square refinements. The work has been supported in part by the Advanced Research Projects Agency.
