Investigation into the Sensing Process of High-Performance H₂S Sensors Based on Polymer Transistors

The fixed sense: A H₂S sensor based on polymer field-effect transistor (see figure) is reported and the sensor shows high sensitivity, excellent selectivity, fast response, good reusability and can detect 1 ppb H₂S. Sensitivity increases first and then decreases with thinner films, which is due to different changing rate of absorption and desorption of H₂S molecules in the sensor.

DNA Repair

D. K. O'Flaherty, C. J. Wilds*

O⁶-Alkylguanine DNA Alkyltransferase Repair Activity Towards Intrastrand Cross-Linked DNA is Influenced by the Internucleotide Linkage

Under repair: Intrastrand cross-linked (IaCL) DNA between two neighbouring O⁶-2'-deoxyguanosine residues by a butylene or heptylene linkage have been synthesized and are repaired by human AGT. These are processed with much lower efficiency compared to identical IaCL DNA lacking a phosphodiester group at the cross-link site, showcasing the influence of the internucleotide bridge in AGT-mediated repair.

Enhancing DNA Crystal Durability through Chemical Crosslinking

Seeing the future: DNA crystals have been recognized as potentially useful tools for nanotechnology applications. However, most DNA crystals have low thermal stability and require high cation concentrations to maintain stability. Here, we describe a simple chemical crosslinking treatment that enhances the stability of DNA crystals under a variety of conditions.

Fragment Screening of Soluble Epoxide Hydrolase for Lead Generation—Structure-Based Hit Evaluation and Chemistry Exploration

The screening room: Both fragment screening and high-throughput screening are used in an integrated hit-finding and lead-generation strategy. Two distinct scaffolds are identified as tractable starting points for further chemistry work. Significant induced-fit binding is observed for the 2-phenylbenzimidazole-4-sulfonamide compounds. A new lead series may be generated if features from the two series are combined together.

Water-Splitting

T. Oshima, M. Eguchi, K. Maeda*

Photocatalytic Water Oxidation over Metal Oxide Nanosheets Having a Three-Layer Perovskite Structure

Size does not matter: Water oxidation over metal oxide nanosheets is performed using IO_3^- as an electron acceptor. It is found that the nanosheet composition has an impact on activity whereas the sheet dimensions do not. Experimental results indicate that the reduction of IO_3^- is the rate-limiting step in the reaction.

Holes transfer at {023} facet/electrolyte interface

Surface Reconstruction of Facet-Functionalized SrTiO_3 Nanocrystals for Photocatalytic Hydrogen Evolution

Facet-rich coating: Surface-reconstructed SrTiO_3 nanocrystals with disordered overlayers are created by a thermal hydrogenation process. The nanocrystals enclosed with {023} and {001} facets in an appropriate ratio show the highest photocatalytic activity for hydrogen evolution. MOR = methanol oxidation reaction; V = vacancy.

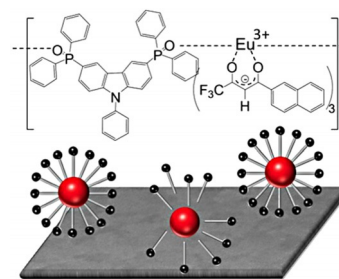

Thin Films

Y. Hasegawa,* T. Sugawara, T. Nakanishi, Y. Kitagawa, M. Takada, A. Niwa, H. Naito, K. Fushimi

Luminescent Thin Films Composed of Nanosized Europium Coordination Polymers on Glass Electrodes

Make a film about it: Luminescent thin films composed of thermostable europium coordination polymers on indium tin oxide glass electrodes were prepared using a novel combination of micelle reactions and electrochemical deposition techniques. The emission spectra, lifetimes and quantum yields of these films were determined.

The Effect of Additives on the High-Temperature Stability of the Vanadium Redox Flow Battery Positive Electrolytes

That little bit extra: Precipitation inhibitors are evaluated in a vanadium redox flow cell at 45.0 °C. The cell capacity without additives drops dramatically after 70 cycles, while the cells with the additives continue to cycle without failure for 120 and 150 cycles for ammonium sulphate and ammonium phosphate additives respectively.

Thermally Stable Explosives

Z. L. Chioato, T. M. Klapötke,* F. Mieskes, J. Stierstorfer, M. Weyrath

(Picrylamino)-1,2,4-triazole Derivatives – Thermally Stable Explosives

New energetic and highly thermally stable salts of 3-(picrylamino)-1,2,4-triazole (PATO) and 3-amino-5-(picrylamino)-1,2,4-triazole (APATO) are synthesized. PATO shows high thermal stability with good energetic performance as a highly thermally stable explosive. The ammonium salt of PATO also shows promising energetic performance with a slightly lower thermal stability than that of neutral PATO.

Gold Catalysis

P.-L. Zhu, X.-Y. Tang,* M. Shi*

Gold-Catalyzed Intramolecular Cyclizations of Cyclopropenes with Propargylic Esters

Going for gold! Homogeneous gold catalysts are interesting as they can act as potent carbophilic Lewis acids to activate the π bonds of alkynes, allenes, and alkenes. We have developed gold-catalyzed novel intramolecular cycloisomerizations of nitrogen or oxygen-tethered cyclopropenes with propargylic esters. Different substitutions on the cyclopropenes make the reaction proceed in different pathways, giving six-membered nitrogen-containing heterocycles in good yields.

Synthesis of Quinazolinones

L. Tang,* X. Zhao, G. Zou, Y. Zhou, X. Yang

Heterogeneous Gold-Catalyzed Cascade Hydrogen-Transfer Strategy for Selective Synthesis of Quinazolinones in Water

Tiny flecks of gold: Au/TiO₂-catalyzed one-pot synthesis of quinazolinones from 2-nitrobenzonitriles and benzylic alcohols is reported. This protocol presents broad substrate scope, good tolerance to air and water, excellent recycling of the catalyst and does not require any additive, oxidant or reductant, which enables an avenue for practical C–N and C–O bond formation.

Effect of Steam-Treatment Time on the Length and Structure of Single-Walled and Double-Walled Carbon Nanotubes

Steamed up: New insights on the role that steam plays in both the length distribution and electronic properties of carbon nanotubes are discussed. Short CNTs can be achieved after 10 h steam treatment with a median length of 200 nm. Raman analysis reveals that wider and outer nanotubes undergo more significant changes than the narrower and inner ones, especially after a prolonged steam treatment.
