

Corrole, ...

... a ring-contracted porphyrinoid with a trapezoid ("mountain-like") molecular shape, was successfully fused to the triply linked dimer by A. Osuka, D. Kim, T. Tanaka, and co-workers in their Communication on page 6535 ff. This corrole was shown to be a closed-shell non-aromatic compound, whereas its reduction with NaBH_4 furnished the corresponding aromatic *3H*-corrole.
