MPS 1200P

The Commodore MPS1200P printer presents the state of the art in dox matrix printers, with all the features of a printer that would cost much more. The MPS1200P is designed to be like three printers in one. It can act just like an Epson FX printer, or with the flip of a switch, it can act just like an IBM Graphics Printer with IBM Group II-I character set (Danish/Norwegian character set) support. It can also print all the characters available with the Amiga in the Amiga configuration. The MPS1200P is capable of all the printing functions you would expect, as well as some additional features you may not expect

up its image. Alastair Scott draws his conclusions on a program which is a failure and would shame a Spectrum.

FROM OUR POSTRAG

Someone called Mark knows lots of long words. A Dutch ST owner dares to write, and colour printers cause many readers more driving problems.

The very best reviews of beezer games

- · Populous solves ommipotence problems. · Prospector is out of the Xordinary.
- · Afterburner takes to the skies
- · Hostages doesn't hang around · Cosmic Pirate plunders an Excellent 92%.
- · Captain Fizz gives the Blasterons what's coming to them.
- · Zany Golf proves greens are good for you as the top game. · Denaris breathes new life into the shoot'em up.
- The desolation of Prison gets depressing.
- Chase proves some software is too expensive even at £10.
- · All this, and more, starting on Page 68.

# NOW DELUXEPAINT HAS ANIMATION

#### Presenting AnimPaint

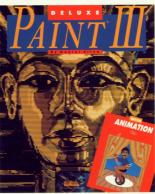

DeluxePaint III makes animation easy. With the AnimPaint feature, you can create animation just by pressing one key to record your point strokes, and another key to play them back. You can also use any multicel animation as a brush

and paint with it, even in

#### **8 New Paint Features**

DeluxePaint III also adds sophisticated features to the number one Amiga paint software: Extra-balfbrite support for 64 colours; direct overscan painting for deckton videb: wrap and fint brush modes for special effects;

better font support; improved compression; and many performance enhancements, including faster perspective. Product requires 1 MB of RAM.

#### SPECIAL UPGRADE OFFER:

Upgrade now and save £50. (Recommended Retail Price £79.99 inc. VAT)
Send DeluxePaint II manual cover and £35 (£30 upgrade + £5 carriage) to
Electronic Arts Ltd., 11/49 Station Road, Langley £13 8YN, England.
Allow 2-4 weeks delivery. DPaint I owners can upgrade for £55.

# AMIGA SCENE

# Commodore regroups

HAVING grown accusitability, Commodore is restructuring its chain of command. We reported the appointment of Medhi Ali from Pepsi last month

He has been joined on the Board of Directors by Dr Henri Rubin who has headed un Commodore research and development for several years. This is part of the renewed vigour with which the company is attacking both development and mar-Europe used to be treated

as a whole, with all 12 divisions reporting to Germany, but they will be restructured into groups of three or four countries which then report to Medhi Ali. It looks as though the UK will not fit into a European group and so the boss of Commodore UK, Steve Franklin, will report direct to Medhi at West Chester, Philadelphia. Marketing in the UK has

seen an emphasis on bundles, with a number of distributors putting packs together. Commodore has now announced the official bundle, which will include a modulator, Nebulus, Star-Ray, Roger Rabbit and the Spritz paint program. What makes the deal really

special is the inclusion of 500 Air Miles. This means you can fly to Paris, Amsterdam or Brussels for free. The A500 bundle costs £499, but you will still be able to get A500s without the gubbins for £399

# More power to your Amiga

POWER Computing is to release a range of Amiga upgrades for everyone from the impecunious A500 owner to the richest A2000 tycoon. The cheapest device is an add-on 3.5in floppy drive which uses a multipurpose printed circuit board. It will work with a number of drive mechanisms, so even when your drive wears out you won't have to junk the whole unit.

The company has more exciting, and expensive, add-ons which live up to the company name - modified versions of the Great Valley Products hard drives.

GVP has a great reputation in America for building high quality Amiga drives, ranging from a 20 meg unit for the A500 at £499 to a 100 meg Quantum drive for the A2000 at £949. Quantum hard discs are

very fast, with an 11 millisecond access time thanks to a cache controller, They have proved very popular with professional Amiga users in the US.

All the A500 drives have special slots which can take up to 2 meg ram and autoboot roms. GVP's newest product is a

68030 card running at 25Mhz which should be at

standard Amiga. It is only available for the A2000 and between unpopulated without the maths co-processor and £3,000 for a board with 8 megs in simm modules The Power/GVP 68030

card is not tied to the Amiga bus speed which makes it very much faster than other speed-up boards A new program from

Power Computing is Video Magic, a desktop video program aimed at people who have to give presentations. This is a big market in the US and one which is rapidly growing in the boardrooms of Britain

The name belies the program's audio capabilities. which allow pictures to be syncronised with sound, either using colour cycling, PASE animation files or by flipping static IFF pictures.

When a presentation is complete it can be saved easily to an autoboot disc with a run-time module. The speaker can set up a script to run or trigger individual events using a remote control which is included in the price of £79.95. For more details contact

Power Computing 0234

art into the Amiga

#### Scanner interface

DESKTOP publishing is growing in importance on the Amiga. Gold Disk, which does the Professional Page DTP program, saw the need for a scanner so that users can get pictures into their documents and has produced an interface for the Canon IX12 scanner.

## Citizen's micro drive

Lovers of small drives will be impressed by Citizen Europe's OU disc drives. The new 3.5in units are the world's smallest measuring 19.5 x 101.6 x 130 millimetres, and weighing 320 grams. This has been made possible by a side mounted disc head and specially designed carriage. This is about two thirds of the height of most Amiga drives without the outer casing.

## Colour DTP on show

NEW developments due in the shops soon include the AT bridgeboard and the A590 hard drive. The Bridgeboard is now available in the US and the A590 hard drive which has completed a pilot production run of 400 units and is in production in the Far East.

A whole bunch of new toys were put on display at the CeBIT trade show in Hanover. There was a colour DTP package consisting of

an A2000 with 3 meg ram, 40

meg hard disc, a flicker fixer, ProPage, ProDraw and NEC Silentwriter LC890 Postscript compatible printer. The system will produce

colour separations and can scan colour pictures using a Sharp scanner and the ASDG interface. A desktop video package for the A500 which includes an RGB splitter. digitiser and genlock was described as being attractively priced.

A high resolution board with 1,024 by 1,024 by 256 colours - from a palette of 16 million - was shown. This is still in the prototype stage and will only be available for the A2000

Commodore seems set to build on its success - Amiga software already outsells ST titles in the Gallup chart. It's looking good

THE first AmiEXPO Art and Video contest was a buge success with more than 200 entrants and over 350 images and videos totalling two hours of viewing time. Entries came from Canada, the continental US and Hawaii. The entrants were of submissions came from female artists, Judges came from the Amiga and computer graphics communities.

Giorgio Gomelsky won the Mixed Media award for works that combined computer generated video with live or prerecorded video with his "CIA" rock video. This has been shown on US TV. Giorgio is known as the Mad Russian and worked with a number of groups in the 1960s including the Beatles and the Rolling Beatles and the Rolling

He used an Amiga 1000, Amiga 2000, Live, SuperGen, Invision, Deluxe Paint II, Page Flipper Plus Effects, Digi-View, Digi-Paint, video switcher. A still shot really does not do the hard-hitting video justice.

# AmiEXPO art was major attraction

Louis Markoya won the category for images created using three dimensional rendering and ray-tracing packages on the Amiga with Woodland'z using an Amiga 2000 with 6 megs ram, Hurricane card, and Turbo Silver. He had to borrow 3 megs for the picture. Louis is something of an Amiga celebrity. He must have spent hours defining the shapes.

Jim Schanz was the winner in the 2D category for artworks created using paint programs with Burmese Penguin Hunt. This was the only winner with a normal Amiga 500 and 1 meg. He used Deluxe Paint II. It is a sure bet he'll be first in the queue to buy a copy of Dpaint III.

# Commodore ups service

CUSTOMERS who have thit problems when claiming under warranty can take heart from a new system installed at Commodore.

Using bar codes, it tracks every product through quality control and distribution, recording each stage on a database. In the event of warranty claims, Commodore can obtain test and sales history on each item.

Industrial software specialist SystemBuild (0778
434388) produced the package in three weeks. It has been installed at Commodore's distribution centre in Peterborough and at a packing depot in Gamlingay near Cambridge by QCD, the company responsible for quality control on all Commodore products sold in the UK.

Each product coming into the warehouse from Commodore's various manufacturing plants is unpacked for testing by QCD. The unique serial number marked on the product at the manufacturing stage is logged into the System Build package which then produces its set of bar codes.

As each product is checked, its progress through the system is recorded on the database.

# Innovation on an Amiga can win £500

A NATIONWIDE search is being launched by Commodore UK to find the most innovative use of an Amiga in the field of hobbies.

The winner, who will collect equipment worth £500, will be named at the Commodore Show organised by Database Exhibitions and to be held from June 2 to 4 at London's Novotel in Hammersmith. "The Amiga is recognised

"The Amiga is recognised as the leading computer in the leisure area, but most people tend to think of leisure computing only in terms of playing games", said Dean Barratt, Commodore's UK marketing manager.

"In reality the Amiga is being used for all sorts of leisure activities from bird watchers logging their latest sightings to horse racing enthusiasts keying in data to try and pick the winners.

"We even heard of one reptile collector who keeps his pets in trim by working out their menus on the Amiga. The potential uses of the computer for leisure activities is endless. We want to find out more about the diverse uses of the Amiga in the home".

All you need to do to enter the competition is to write a brief description of how the Amiga helps your hobby – no more than 500 words – and send it along with any support material on disc and the entry form to Amiga Computing.

In turn, the editor will nominate the most outstanding entry received by the publication to go forward to the grand final which will be held at the Commodore Show

All finalists will be invited to demonstrate their innovations in a specially designed Leisureama feature area

ations in a specially designed Leisureama feature area. During the event, editors from the leading Commodore magazines will form a panel to select the winner.

8 AMIGA COMPUTING May 1989

# Amiga v ST battle at Menzies stores

THE Amiga is set to take on its main rival in a High Street battle. Its protagonist is the Atari ST, the battlefront is spread throughout Menzies stores and to the victor could go the lion's share of Menzies' sales next Christmas.

Menzies cut the number its shops stocking the ST after disappointing sales last year and for the first time has brought in the Amiga as a serious challenger to the Atari machine.

"It is a case of sussing out what the customers want", Menzies' merchandising manager Bob Shingleton told Amiga Computing. "The volume of Atari ST sales certainly did not come up to our expectations".

Starting from March, Menzies has cut back the number of stores stocking the ST from the Christmas figure of 45 to 20. For a trial period, it has put the Amiga into 14 stores and will be monitoring sales of both throughout spring and summer.

The aim of this exercise is to established which 16 bit hardware will be stocked in readiness for the next Christmas boom. It is thought unlikely that Menzies will opt for both machines.

### Accent on presentation

THE prestigious Desktop publishing Show organised by Database Exhibitions (0625 879970) will take on a new look this year with Presentations '89, described as a unique "show within a show", highlighting the art of professional presentation.

It will be held at the London Arena in the city's fast developing Docklands from October 4 to 6.

PIRA, the leading indenendent advisory service, will combine with a team of recognised authorities to run a series of seminars covering the full range of communication skills.

Database Exhibitions managing director Michael Meakin said: "The new professionals in computer graphics and the more traditionally based audio-visual specialists both have much to offer the marketplace individually, and even more to offer when they can come

together in a single forum.
"Converging technologies
is the way forward, and this
is what Presentations '89 is
all about".

# Video via the Amiga

UALITY video output for the Amiga has caused problems in the past but Farnham-based G2 Systems believes it has now cracked them. G2 (0252 737151) has just

G2 (0252 737151) has just launched its Amiga VideoCenter which it claims gives quality output at a reasonable price.

It combines the facilities of a video mixer, genlock and PAL encoder, mixing incoming video signals with computer output either using sliding faders or under soft-

ware control. G2 has not finalised pricing but promised it would be under £600.

# **|**\*|

# PageStream joins the DTP battle

JIM BUTTERFIELD reporting from Canada

DESKTOP publishing systems and PostScript interfaces are proliferating. PostScript and properties, properties are properties, properties are properties, properties and properties. I standard properties are properties.

Traditionally, the logic and lots of supporting memory - has been built into the printer or typesetting device. This can be costly.

device. This can be costly.

New systems put the logic
into the Amiga. This allows
for PostScript drafts output
to much less expensive printers, but calls for a good deal
of ram within the computer.

Professional Page, a

Protessional Page, a desktop publishing system by Gold Disk, started as a PostScript device only, but has been upgraded to allow output to dot matrix printers. Its output is essentially a

PrintScript is a PostScript interpreter now shipping. This program acts as a Post-Script print driver and is usable with a variety of desktop publishing programs that think they are working directly with a Post-Script printer.

PageStream is a desktop publishing system. It was formerly announced as Publishing Partner, but the software house apparently decided that there were too many PP names in the Amiga market. PageStream is long-

awaited, partly because

s- SoftLogic advertised it for almost a year before recently g. starting to ship:

The print quality of this package is widely praised, but the initial release is reported to have a number of operating anomalies – bugs, or perhaps complex usage rules.

Users on many networks are grouching because the Amiga doesn't get the amount of attention in the press 'that they feel it deserves. There is talk of campaigns to give the Amiga more visibility, especially in business applications.

On one board employees of a Wall Street public relation firm are outlining methods to approach the media for better "Amiga consciousness"

The Lattice C Compiler, version 5.0, has been slated for an upgrade for some time to fix problems on the initial release. After a number of production delays, the upgrade disc - identified as 5.02 - has been shipped to all registered users.

The upgrade contains

extensive replacement files and patches for the five-disc Lattice C system. You need only trigger the script file and all upgrades will take place automatically, with requesters calling for insertion of the proper discs as needed.

The modifications are extensive and the upgrade activity runs for about an hour on a floppy disc system. Users with a hard disc will see the time reduced to 15 minutes.

# Into a new domain

DVENTURES are changing.
Once there were only text
games, anything graphic was all in
the mind. Then we had what we
glibly called graphic adventures,
similar types of games but with some
pretty crude pictures that, if anything,
destroyed the pictures your mind
built up from the text.

With the coming of the Amiga, these graphics took a healthy step forward. Some can actually improve our mental simulations of places far away in space and time. Mouse control is a logical roll forward. Apart from suiting us lazy types, it is an excellent way to keep a good flow of play, especially in role playing adventures. In the Jargon Dungeon

Master is "third generation".

A new adventure in this category is Galdregons Domain from Pandora Software – good graphics, a smooth mouse and icon command structure, and a role playing game that will tax those little grey cells.

under mite gety clus. Had Galdregons Domain appeared before Dungeon Master it would have received better reviews. Dungeon Master has slick graphics with animation and you are prompted to tackle it in a very definite, systemationer, Galdregon is free ranging, as no animation, and although to win through you must solve some sections in a strict order, there are few hints as to the torder.

You play the part of a barbarian, a northlander skilled in the use of arms. Seeking fame and fortune you visit the city of Secnar. There you are enlisted by its king in the fight against

Resting at an inn. Mine host is the fat one, and a cleric stands by to sell you healing

the evil priests of Shool.

The priests have resurrected the long dead wizard Azazael, who intends to seek vengeance on all mankind. His aim is to find the five lost power gems of Zator and use them to control and enslave all who stand against him.

OUR quest is to find the gems and return with them to the king. The location of only one gem is known—it is in the hands of an evil Lich, an undead wizard, who rule the catacombs under the city. You stand no chance at all against the Lich and his minions unless you can retrieve the other gems, gaining experience, weapons and armour in the process.

Leaving the castle you will meet many creatures, not all evil. Question them. Some will provide useful clues, some will merely pass the time of

There are mysterious cottages, inns, forests and towers to visit. Rangers, elves, gnomes and hobgoblins wander the countryside. You must be careful not to enter into battle too readily. Kill the wrong opponent and you could bring down the righteous wrath

of his companions.

Leaving the castle you have only food, a lantern, a dagger and a healing potion. A visit to nearby cottages will provide you with a magic sword and a few magical scrolls. You are now equipped for the first stage.

Any weapon you find will sooner or later break in the heat of battle, so make certain you have a back-up weapon ready. Once you have overcome enemies you can take whatever they were carrying. Various small flasks will contain potions. Watch aut for poison.

Scrolls are once-only magic spells written on human skin. They range from a simple spell to give light to useful offensive ones to summon up fireballs or poison clouds.

Half of the screen shows your view, beneath which is a line of sideways scrolling text. The lower part of the screen is the command area accessed with the mouse, icons and menus.

Food and drink affects stamina, healing potions or clerical cures. Strength can be won with potions or spells, and also appears to increase as you progress through the game and acquire better armour.

Click on the right mouse button and the display changes to the inventory screen, a picture of you on the left, and two pull-down menus showing you what you are carrying and what is on the ground.

Clicking on a dead body shows what the creature was carrying; click on a chest or bag to see what is

Inventory, showing the number of gems and gold coins found plus what you are wearing

4

inside. Items may be dragged from one menu to the other, although there is a weight limit to what you can carry around with you. Armour you want to wear should be dragged directly on to your body.

When out in the open, clicking twice on the right button displays a map of the countryside with a cross showing your location. It shows all except one of the major places of interest, although you may not realise their importance just from the map.

OVEMENT controls seem slightly strange. If you see a door in a building, but not exactly in the centre of the screen, you must go past the building and then turn towards it before you can enter.

Cottages are simple one-roomed or two-roomed buildings, towers are two storeys high and have a few more rooms.

Forests, the Caves of Doom, the Temple of Set, the Labyrynth and the Castle all have a number of locations and must be mapped very carefully. Note that walls, whether made of trees or brick, may not have any thickness, so watch what you draw on squared paper.

When you are in forests or underground caves there is an indication of when a path leads off to the left or right. In other locations what appears to be a continuous wall to one side may contain a doorway which is not visible unless you look directly at the wall. Before you start make sure you

have several formatted discs ready to

Ferocious minotaurs give battle in the depths of the labyrinth

Watch out for Medusa. Her face turns warriors to stone

save your game position. It is very easy to die in Galdregons Domain – most of the special locations have hordes of unpleasant creatures just itching to spill your blood.

It is easy to buy ale to increase your

stamina, or a cure to improve your health. Unfortunately it is not as easy to find the money with which to pay for them.

Scrolls and potions have to be used to the best effect for the supply isn't inexhaustible.

My review copy seemed to have a few bugs that scattered the lower half of the screen with coloured pixels, a situation that grew worse as I progressed. Still, Galdregons Domain is a welcome addition for the role playing gamer. Let's hope there are some more like this in the pipeline.

# REPORT CARD

A cracking role playing game for the bloodthirsty. But lives in Dungeon

Double Click on the right mouse button to get a map of Mes

ACTIVISION has always been a strong supporter of our computer addiction. Infocom, Sierra, MicroIllusions and Abstract Concepts are all names associated with computer adventures, and 1989 looks like being a bumper year for Amiga conversions.

The King's Quest series (I, II and III) has taxed more than 750,000 adventurers. Tens of thousands of words have been written in the USA on how to play these adventures, so they have got to have something going for them.

going for them.

King's Quest IV will appear shortly
on the Amiga. It is going to be a big
program, which means there is going
to be a fair amount of disc swapping
as you progress. One IBM version has

nine discs...

If medieval type fantasy is not your thing then Sierra may still have something to interest you. There is Leisure Suit Larry If – Looking for Love. It's an outrageous parody where Larry, still intent on finding his dream girl, gets involved with everything

from foreign agents to Hairy Krishnas.

For something a little more serious

you could try Manhunter, a science fiction epic set in New York a couple of years after an alien invasion. You play a detective hired by the aliens to keep track of their human underlings with the option to play either the good guy or the bad.

ILLENIUM 2.2, is also set in the future. It is a strategy adventure set on the Moon shortly after an asteroid collides with Earth, making it uninhabitable. Your task is to transform the planet back into a habitable condition for the future.

It looks fascinating; you must initiate research into various forms of transport, weapons and power sources, send out probes and mining expeditions around the solar system and generally develop the technology required to achieve your aims.

required to achieve your aims.

Not only is Millenium 2.2 a first class game but for those interested in astronomy it is an education to view the correct orbits and relationships between the planets and their moons.

#### DUNGEON MASTER

- Got characters that have no magic? The wand found on level three will give them some starting mana then practise like mad.
- Only attack Beholders when their eyes are closed.
  Top food calories go to dragon
- steaks, then rat drumsticks, then bread. Least nutritious are the worm rounds.
- Want extra strength? Cast Priest spell LO (to MON) FUL BRO KU into a flask.
- Can't get into level six? The answers to the riddles are blue gem, bow, gold coin and nothing.
   Put these items in the recesses and the door will open. You can pick them up afterwards.
- To get the sword protected by poison darts on level 11 break down the door so that you can get out again quickly. Strip off heavy armour before you run into the
- Before you kill the dragon on level 13 make sure you pick up some copper coins and drop them by the door to the Altar of Rebirth. Then if you have dead companions you can pay to open this door outckly when necessary.
- quickly when necessary.

  If you are having trouble killing the dragon, keep dodging to his side or behind him. Hit him quickly before he has time to attack you.
- Can't get the Power Gem? ZO KATH RA creates a ball of force that will replace the Gem when placed on it.
- Remember that you can only defeat the Dark Lord by trapping him within a flux cage using the Firestaff plus Power Gem. Create flux cages around him, not on him

Let us know if you have any interesting solutions to puzzles in adventure games on the Amiga. They may will be where other people have got stuck and are just waiting for your hints and tips. Send them to: Adventure Tips, Amiga Computing: First floor, North House, 78-84 Ongar Road, Brentwood, CM15 9BG.

ORDPERFECT Library is a group of programs covering a range of uses. It is not a single program or an integrated suite. They are not connected with WordPerfect, although the Notebook may be used to share data with it.

In typical WordPerfect fashion, the package consists of a large box containing a ring binder manual, two discs, keyboard templates and sticky labels for Amiga 1000 owners to mark their numeric pad keys. The program is not copy protected.

I sometimes wonder whether manufactures price their products according to the size of the manuals. The WP Library one is more than 660 pages long and describes the programs in the most minute detail. It is divided into sections for each program and an overall section on installation and getting started.

No one could possibly criticise WordPerfect Corp for skimping the documentation. The whole thing is over-facing. In the tutorial sections, virtually every keystroke is described, mouse options being relegated to a brief mention on the right of each page.

Some of the programs make extensive use of the function kevs

# **Poor relation**

When a program shares its name with the world's best selling word processor you'd expect something special. David Foster did

with combinations of normal, Shift, Control and Alt, in much the same way as WordPerfect. This is something I have never really liked. I find it far from easy to remember all the different key strokes and had to refer constantly to the keyboard template.

Even though the manual gives full instructions for installation on everything from a single drive model to one with a hard disc. I think it is best suited to a computer with lots of memory and a hard disc. And if you have the sort of money WordPerfect Corp thinks you have you'll also have a hard drive.

The suite consists of five different programs – a File Manager, Text Editor, Notebook, Calculator and Calendar. All may be run from Workbench or CLL.

Guru meditation struck three or four times. One is repeatable and happens when using the Zoom gadget in the Calendar program. I was unable to repeat the others, which is a little disturbing with programs that might contain quite a lot of important information. The moral must be to save data recularly.

Each program is good, the Editor being the weakest. Deciding whether WordPerfect Library is worth the money is tricky. If you were to go out and buy individual programs to do the same jobs they would probably cost you a lot more than WP Library. But would you? This is a very expensive way to buy a flash calculator and file manager.

Even if you wanted them, have you got enough memory to load several programs at the same time? The whole point of programs like these is that to be of much use they must be to hand at all times. If they aren't they won't be used on a regular basis. I think you need about 2 meg of memory if you want to take full advantage of Library.

ILE Manager is a program to help with disc housekeeping. Its biggest advantage is that it lets Workbench see all the files on a disc, not just those with icons attached.

On the screen is a window which contains details of the first 14 files in the current drawer. The name, size, time and date last modified are shown. Three buttons let you choose between display in name, size or date order. The amount of free space and the number of files are indicated.

The right-hand side is filled with buttons. They provide options to change directories to Root, Parent or Previously used as well as Look at text files, Delete, Rename or Copy a file or group of files. The only omission is the option to view a screen.

You can create and delete directories. Files can be marked, moved, copied or deleted as a group.

There are three different types of search – find file, find date and find word. Find file will scan the disc for any filename matching a pattern. The program betrays a

little of its PC origins here, as the wildcards used to indicate are the MSdos? and \*.

Date and word searches only work on the current directory. All files which match the specified range of dates are marked. In the latter, the search finds all files which contain occurrences of the specified word pattern and highlights them. The slow search can be restricted to marked files. which reduces the time taken. Double click on a directory to move down the tree. Clicking on the Previous button returns you to the original directory. Another useful feature is an extra gadget on the right of the status line. Clicking on it closes the window, but leaves a small Status line at the top of the screen. Clicking on the gadget again will redisplay the Pile Manager screen as it was before.

ALCULATOR is a much more extensive product than the one provided with Workbench. Like File Manager, it can be shrunk to a single line on the status line when not needed.

Three different modes, Scientific, Programmer and Financial are available and just about every function you could possibly want is provided in each mode, including some that I never managed to get the hang of at college and others I have never even heard of

Programmer interested me in particular, with its ability to work in hex, binary, octal form as well as decimal. Many other features, such as Shift, Rotate, AND, NOT

and OR functions are available.

For the masochists of this world,
Reverse Polish Notation can be

ROGRAM Editor is the one used by WordPerfect when developing its software. In view of this I was expecting something special, but ended up being a little disappointed.

Multiple files can be loaded and windows resized. If windows overlap, or you are editing more than one file with full sized windows, mouse control becomes very jerky.

Unnecessary screen redrawing sometimes slows things down. The editor makes heavy use of the function keys. Wherever possible, they are given the same functions as WordPerfect.

The editor offers several special functions apart from all the usual Cut, Paste and Copy. Marked blocks can be converted to upper or lower case and the Duplicate command reproduces the line above the cursor. Auto-indenting is supported, as is the facility to indent or un-indent lines, or blocks of text - particularly useful when re-arranging source code

It is possible to disable the scroll bar to speed up scrolling while a special Rewrite command is provided to redraw the screen and update the scroll bar at the same tima

There are complex macros with one macro being chained to the next as well as repeating or conditional macros. Macros may be replayed either by name, or by using a designated Amiga/key combination. Delays and pauses for keyboard input can be inserted into them and macros may be

In spite of all its features, I did not feel at home with the editor, largely due to the inability to redefine the keyboard configuration.

OTEROOK is really a database. You can create a number of Notebooks which can contain different types of data. A list display shows data for a record on one line, with several records visible at the same time. When only some fields are visible they form an index of records which may be viewed in a separate display by pressing Return. A configurable record display can be

Facilities are provided for rearranging data. Sorting can be carried out on any fields displayed in the list. If identical entries are found further fields may be specified for ordering

Specified text can be searched for throughout the database or

restricted to certain fields or marked records. It is possible to mark occurrences automatically or manually in list view by double clicking on them

Function keys are used, although options can be selected from pull down menus. Online help is available. Macros are supported and are implemented and used in the same way as in the Editor

A Dialler option uses a modem to dial numbers stored in a phone field in records.

Printing facilities are comprehensive. Either the whole Notebook or marked records can be printed. Not surprisingly, full facilities are also provided to import and export WordPerfect Merge files.

ALENDAR is more than it sounds. It integrates an Appointment List, a To Do list and a Memo Pad with the calendar, in such a way that when you select a date it will display all the appointments for that day in their respective windows.

You do not need to display all the windows, and Calendar may be configured so that only the windows you use are opened when it is loaded.

Dates can be marked so that you are warned when an appointment is approaching. This feature is only implemented if you load an alarm program specifying the name of the Calendar file with the Appointments List. At the appropriate time a requester opens over your current program, displaying details of the appointment. You can have priorities attached

to any entry in the To Do list and they are automatically rearranged if priorities are changed. When a job has been completed it can be

marked as such and is automatically moved to the bottom of the list. Powerful search options can be used to look for any occurrences of text in the Calendar file with wildcards.

WordPerfect UK 0932 231164

The File Manager is ideal for hard discs. Other programs are useful if you can load them permanently. Function keys are far from memorable. Crashes.

Nothing exceptional here, the screen redraws are a little sluggish.

VALUE ... 

Good value if you want all the programs, but if you only want one or two, expensive

A good selection of programs, well

implemented on the whole, but not the sort of package to buy unless you need most of the functions.

# MIGA Mail Order Offers

At last, an inexpensive and very easy-to-use spreadsheet that's simple enough for beginners, yet sophisticated enough for professionals.

Digicalc is both menu and command driven. It is fast, with all calculations being performed instantly, and the spreadsheet is constantly updated

The manual has been carefully designed to cater for all types of user, from the novice to the expert. It includes a tutorial with step-by-step instructions, a glossary of

'I really liked the package to begin with, and first impressions are important... Digita deserves full marks for the way in which the menus and command driven operations have been implemented... It's a no nonsense spreadsheet... I'd certainly recommend it for general purpose spreadsheet work". - Rex Last, Amiga Computing, December 1988

# **Better** Rushing a product out can ruin its future, says Alex Aird as he compiles his views on GFA-Basic

ASHION dictates that hip coders use C. There are good reasons for this, one of the best being that it allows you to slag off programmers who use Basic. But the Basics are fighting back, offering the structure C programmers use as ammunition.

GFA Basic is one of the new breed. offering advanced features without having lost touch with its beginner's roots. It comes with an impressive A5 ring-bound manual in a library slip case. The manual describes GFA Basic as "an extensive programming language with a comfortable development environment

Extensive is certainly the right word

- the manual, which is little more than a list of keywords, is over an inch thick. I didn't care too much for the documentation. Collecting keywords in logical groups seems a good idea, but I was constantly referring to the index to find commands.

coders

at it

iere

ure C

reed

mi

er's

re A5

lip

ing

word

There are a few amusing errors, probably due to the manual's German origins, and the odd line missing from some example programs, but no major disasters.

GFA Basic can be started from Workbench or CLL. When the editor is loaded you are presented with a single window into which you type your programs. At the top are 20 items which can be selected with the mouse or function keys.

You can use an independent editor, thanks to multi-tasking. I tried running GFA alongside the small version of Protext with a \$12k expansion and it seems to work OK. I found it quite handy to be able to try something out in Basic, save a demo program as an Ascii file, then switch to my word processor and merge the demo into this review.

THE first thing you will notice is that each line of the program you type is checked for syntax errors as soon as Return is pressed. An error must be corrected immediately. The editor will not allow you to enter another line until the error in the current line has been corrected.

GFA Basic does not use line numbers, and only one statement is allowed on each line. For example PRINT-PRINT is regarded as a syntax error. Loops are automatically indented, which helps program legibility when several loops are nested.

Program control is very important and is achieved by using loops and conditions. GPA supports several types. The usual ones such as FOR ... NEXT, WHILE ... WEND, REPEAT ... UNTIL, DO ... LOOP are there but have been extended in GPA to include DO ... UNTIL, DO ... WHILE, LOOP ... WHILE, LOOP ... WHILE, There can also be exits from a loop using EXIT ... IF

Even the humble IF ... THEN ...
ELSE type of condition testing has been greatly expanded. A simple form

```
GFA-BASIC 3.82
                       I New
            AL.
                   ist | Block
            AIS
 New Names MIN
                 e color for the PRIN
           [4]3
  ESSESSED Allence: chr$(&H9b);"(St
 Taskpri 1 21
                  Plain Text
Bold-Face
           AIC
 Cleanup
Save Icon AI
                  talic
 NewCLT.
```

The only pull-down menu. All other options are chosen by clicking on the control bar

```
of this loop is:
```

```
IF a=1 THEN
PRINT 'a equals one'
ELSE
PRINT 'a is not equal to 1'
ENDIF
```

More complex forms of condition testing are supported by GFA:

```
OPENS 8
10 150KETS
15 154"
PRINT'Load'
ELSEI: tim'S'
PRINT'Save'
ELSEI: tim'S'
PRINT'Save'
ELSE I tim'S'
ELSE PRINT'Input'
ELSE PRINT'Input'
ELSE PRINT'Unknown Command'
ENDIP
```

It should be noted that the keyword THEN is not obligatory. The whole structure of the condition testing employed in the above listing makes the program readily understood by anyone. The indentations are automatically put in by the GFA editor to make program listings more readable.

Another example of loop structures in GFA Basic is:

```
OPEN 8

DO LOP UNTIL MOUSEK

DO UNTIL MOUSEC=2

DO WHILE MOUSEC=1

LINE 8,8,MOUSEY,MOUSEY

LOOP UNTIL INKEYS=" "
```

This short listing allows you to draw

a line by pressing the left mouse button – that is when MOUSEK=1. You exit the program by pressing the right mouse button or the spacebar. The DO ... LOOP makes the listing much neater than a WHILE ... WEND.

The GOSUB ... RETURN subroutine structure is supported in the form of procedures which can have local variables. The abbiguitous GOTO has not been left out but there are restrictions as to its use – no GOTOs just before a Return, for example. Structured programming is no bad thing especially for a newcomer to Basic; those who prefer pasta will have to adapt.

For debugging a program GFA has TRON. TROFF and TRACES, allowing program execution to be traced. There are a few variations of these commands. One of the more powerful is the ability to send the trace output to a file or to the printer. For example to send trace output to the printer use

```
OPEN '0',#1,"PRN:"
TRON #1

'section of program being traced
TROFF
CLOSE #1
```

the following.

By putting a DUMP command within a program all variables, labels, procedures and functions can be listed during program execution. This list can also be sent to a file. GFA Basic has many commands

The device gadgets are worked out from the mountlist - the correct way to do it

Programs can be run without having to load the full GFA Basic interpreter

that relate to file handling. All the usual types are supported such as sequential and random access files. In addition there are a few extra commands.

STORE enables the programmer to save a string array to a text file – I can hear those Spectrum programmers counting their pennies now. The complementary command RECALL reads back a string array. If the end of file is reached then no error message is produced, instead a simple variable holds the number of items read.

ENU commands let you add drop down menus to your programs. This is abetted by a simple way to include keyboard short cuts within the menu selections. For example, if the sixth item on the menu was SAVE and you wanted to add Amiga-S as a short cut, then add a single line MENU KEY 6.83. The symbol for Amiga-S would be added to the menu and the command ON MENU GOSUB would also recognise the shortcut. Submenus are created by putting an exclamation mark before the menu entry. One of GFA's nicer features is the

command FILESELECT. This is very

useful when you want to load or save files from within a Basic program. If you write a database type program for example, you will want to load or

OPENN 48 DIM a5(18) 11:0 READ a\$(il) EXIT IF a\$(il)='e' INC IX 1.009 a\$(il)=" DATA 'Project',' Load/Save DATA "! Load ","! Save DATA Other,\* MENU a\$() MENU KEY 2,76 MENU KEY 3.83 ON MENU GOSUB menuselect

PROCEDURE menuselect
IF MENU(#)=2

GOSUB loadfile ELSE IF MENU(8)=3 GOSUB savefile

PROCEDURE loadfile FILESELECT "Load File", "Load", "RAM:", a\$ 'actual load commands go here RETURN

PROCEDURE savefile FILESELECT "Save File", "Save", "RAM:", as 'actual save commands go here actual save data.

A little box is put on screen and a list of files in any directory displayed with just one line of Basic. Files can be selected for loading or saving by clicking the mouse button.

Producing impressive graphics is simple. And after a quick look at the demo programs I felt that it would be fairly easy to write good graphics programs using GFA. It has all the commands that you would expect such as LINE, CIRCLE, ELLIPSE, BOX, FILL, GET PUT and so on. Also some you may not expect, like SCROLI, to move a rectangular area of the screen and a methoded of the screen and a methoded

Now inputting fd 50 rt 90 fd 50 at the input prompt would draw a line 50 pixels long and turn the imaginary turtle 90 degrees to the right then draw another line 50 pixels long. To anyone who has ever played with Logo this would be quite familiar.

There is rumour of a compiler coming soon. When that appears

4

copy I had of GFA Basic was version 3.0. I had lots of problems with it so sent it back for a replacement. A week or so later, version 3.02 arrived. On the disc is a file called changes.readme. This was a five page

document detailing all the bugs that had been fixed, plus details of some new keywords that have been added. This later version is not without its problems. The most serious perhaps

is that the machine hangs after printing a program listing or after changing a disc. The only way out in either case is to reset

When I got my second drive halfway through this review I thought I could load the Workbench from DEO: and run GFA from DF1: but GFA Basic will only autorun

programs properly from the internal drive.

The search and replace function does not work, it will find but not replace. Changing between insert and overwrite mode puts another cursor on the screen. I had 10 cursors on screen at one point; quite confusing

To enter direct mode you can either click with the mouse or press a function key. The effect should be the same, but it is not. I sent the disc back a second time because of these problems, but after more than two weeks I have heard nothing more from Microdeal

This product has been rushed, leaving the unfortunate purchaser to do the what should be pre-release testing. What GFA Basic does, it does well. It is faster and nicer to use than AmigaBasic and has some good extra features. And despite the bugs I like

I get the feeling though that it will get a bad reputation and never be

considered as a serious tool for Amiga programmers. This will be a shame because with a little more work it could be the best

SHO

Product GFA Basis Supplier Microdeal 0726 68020 Price 064.95

OK until it crashes. You need to reload after doing minor things like swapping floppy discs

Very much faster than AmigaBasic. especially when using graphics.

I wouldn't go out to buy GFA Basic after all AmigaBasic is free

A missed opportunity, but it's not too late for the programmers to fix

Priose such sixe of VAT unless otherwise stated and correct at time of coing to press Education calliers ask for Tony Judge or Mark Butler
Come in and see in at 1003 High Street, Chadwell Heath, Romford, Fasey

LEVATORS which feel like helicopters take some beating. AmiExpo New York was held at the Marriott Marquis Hotel, which is distinguished by having the tallest atrium – or lobby – in the world. The glass lifts whizz up and down the 50 floors at breakneck speed, taking a

couple of floors to slow down.

New York is famed for magnificent skyscrapers, but the Marriott manages to provide spectacular sci-fi style views inside the building.

# America loves Amiga

Simon Rockman reports from the Amiga Show in New York Attending AmiExpo is not cheap.
At around \$1.75 to the pound, tickets
which cost \$20 for one day and \$30
for all three days worked out at
between £11 and £17. There were a
number of intensive classes on using
the Amiga as a video tool, the art of
Amiga att, programming in C, using
the Amiga for music, desktop
publishing and animation.

Distance and the same and the same and the same as were taken by James Sachs, who also gave a talk pushing forward the quality of Amiga software. He showed a video tape of his current project, 20,000 Leagues Under The Sea, which is being produced in conjunction with Disney. The game is still a couple of years from completion, Most of the graphics are finished and he is now working on the programming.

This is pure machine code. James has no truck with multi-tasking or C. The demo was spectacular, with the kind of graphics that make even blasé Amiga owners applaud. But what will turn it into a really special game is the music and the load speed.

The Nintendo games console has been very successful in the US and Mr Sachs contends this is because cartridge games load instantly. 20,000 Leagues will start running within a second of putting the disc in the drive and be playable within three seconds.

AMES revealed a couple of home truths about Roger Rabbit. He admits the game has a couple of problems because it was rushed out in 90 days on the Amiga, PC and C64, but he is proud of the quality of

animation which owes more to the traditional cartoonist's skill than any computer game previously.

What made the video special was the sound. The game will have a Wagnerian soundtrack produced by mixing samples from a collection of digitised instruments. James admits to tipping his hand to other software developers, but would rather see the standard of games improve than live with hissy samples.

The music course was run by Dean Friedman, the musician famous for hits like Lucky Stars, Rocking Chair and Lydia as well as the music for Boon. Dean is acknowledged as something of an Amiga Mdid expert in America where he runs the New York School of Synthesis. Look out for his articles on the Amiga and music in future issues of Amiga Computing.

The show provided a chance to meet a lot of the people who have made the Amiga – not the big companies, but the user groups and magazines. There were several stands selling PD software; programs to do pretty much anything you wanted were available for \$4 a disc.

TeWTEK showed the Video Toaster (again). It looks as though this super-duper video mixing card for the A2000 really will go on sale this summer in NTSC form. But a PAL version is a long way off.

Tim Jennison, the owner of NewTek, claims that a European version is pretty tricky. The higher definition we have on our televisions means that the card needs more ram and quicker processing. The problems are exacerbated by British companies being much fussier about the quality of television pictures than US stations. But Tim admits there is probably a

big enough market to make the project worthwhile. Just as soon as the NTSC version is out and he has had a holiday – sorry, vacation. Other attractions to the NewTek

stand were DigiPaint III, which will be available soon, and a stunning demo by Allen Hastings. NewTek glossed over the jump from DigiPaint to DigiPaint III without the usual business of messing with a DigiPaint II. Perhaps the spectre of Deluxe Paint III was looming too large.

R&DL productions were on home territory and used the show to launch Lightbox, a drawing program which allows an animator to see frames of a cartoon as though they were drawn

Allen Hastings had some great new demos

on layers of tracing paper. Individual frames can then be saved and coloured in using something like DPaint. R&DL has applied for a patent on the system.

on the system.

Impulse Software had some demos
to go with Turbo Silver and promised
Turbo Silver III soon. This habit of
not having a version II is catching.

The company also showed a 3D system like the Haitex using the Sega glasses. It allows up to four players to take a squint and they look more like Ray Bans. It's hard to act cool, let alone save the universe, wearing a welding mask. This combines with Silver to produce great 3D animations.

Impulse also has a musical instrument. You sing into a microphone and an interface converts the sounds into musical notes. This will cost \$199.

Were showing Viva, an interactive visual authoring system which is aimed at the computer based based training market. It uses a standard video disc player and the Commodore A2300 genlock. There are three versions of the software, coating between \$50 and \$500. conditions of the software of the work of the

This DTP package has been a success on the ST and now aims to repeat the performance on the Amiga. The software costs \$199.95 and offers advanced text editing with spell checking in addition to the usual DTP functions.

It will produce colour separations.

so that high quality colour can be produced by getting a proper printing company to run off pages, and supports colour printers. Pagestream will also produce high quality output on non- Postscript printers. A full review will appear in Amiga Computing soon.

Syndesis announced a couple of improvements to its range of shape translation programs. Interfont can turn normal bit-mapped Amiga fonts into the wire frames a program like Sculpt 3D needs. It will also allow you to edit the shapes, and has recently been upgraded to include the Ageis Draw format used by Professional Draw and Turbo Silver 3.0 format.

A departure for Syndesis is the move into networking software. Bob Tolly has written a DECnet emulation which uses the serial port and allows the Amiga to be connected to a mainframe as though it were a dedicated terminal. This should be help establish the Amiga in the high end workstation market, but I can't

4

see any sales to home users.
The Amiga has always attracted
users who want to do more and go
faster. With the official Commodore
A2620 on sale, third party companies
have moved up market. Great Valley
Products announced a 68030 card for
the A2000. This will be available in
16 and 25Mhz versions, which at a
uness will be between 10 and 15

times faster than a standard Amiga.
Some clever circuitry lets the 88030 run faster than the rest of the computer and still access the memory at maximum speed. A socket allows for a floating point co-processor. GVP also announced a 44 meg removable hard drive for the A2000.

OLD DISK did not have a stand at the show, but took the opportunity to announce a number of new programs and some hardware. Design 3D has been previewed before, but at AmiExpo it was nearly finished and looked really good.

It is a modelling program which interfaces with Videoscape but has a friendly front end. Objects can be created in 3D with four views – top, front side and perspective. Up to four light sources can be used. It looks a useful tool, but a bit pricey at \$99.

More exciting, for me at least, was Transcript, the second program in the new Gold Disk home office series. It is billed as a writing/editing tool, but is really a word processor. Transcript is designed to be small

Iranscript is designed to be small and quick to use, ideal for multi-tasking with Pro-page. There is a 90,000 word spell check which can be run as a separate task. A special mode lets you see – but not alter – what output will look like. At \$69.95 it looks a good buy.

I said it was the second Home Office program. The first will be

know him as Sodan

Home Budget. This is a book balancing tool which helps look after things like home bank accounts. The first move into hardware is an

interface for the Canon IX12 scanner.
The scanner will read an A4 page in
15 seconds at 75, 150, 200 or 300 dpi
and turn it into an IFF file. It is set up
to use fast ram because an A4 black
and white page gobbles up a meg at
maximum resolution. The US price of
\$1,005 is unlikely to be reflected by
the UK price, where the scanner costs
£1,400 for the IBM PC.

One item of hardware seems to be particularly popular with developers at the moment – the multiple serial board. ASAP in Scunthorpe is about to release Amiox, an eight parallel, eight serial port device.

CMI from Oregon announced CMInet, a networking card with two serial and one parallel ports. This includes some custom software.

ASDG launched the incredibly fast DSB or dual serial board which adds two extra RS232 ports to the Amiga. Perry Kivolowitz from ASDG showed me two Amigas linked with the cards and transferred a file between them at around 10k a second. The card costs

\$299 and will be a useful peripheral for A2000 owners with several machines.

Games were very low key. Psygnosis was showing Blood Money, an impressive Menace type game for two players, on its stand. A novel feature allows players to buy weapons by collecting money dropped from the aliens they shoot. You will have to get on well with a partner to get very far.

The only other games software house was Visionary Design Technologies – responsible for Dregon's Lair – which has now moved on to more traditional games, a defender clone called Questron and a funny breakout in the round called Vortex. Questron is by Seron Grenbech the programmer who wrote Sword of Sodan. He has now moved to Canada and is on the Visionary Design team.

Many Amiga owners have asked for a portable Amiga. Dale Luck, from Commodore-Amiga built himself one using an old Sch-6 case. The small screen is far from satisfactory so Micro Momentum has come up with an Amiga in a brieficase design which uses an amber monitor. The whole thing looks very Heath Robinson, so I can see technology has a lot of calching up to do before a portable Amiga becomes viable.

HERE was a lot to see in three days, which made for a great show. American Amiga users are a great and dedicated bunch. They obviously get a lot out of using their machines and the healthy PD libraries are a tribute to the work they have put in.

Lots of people seem to have A2000s and A500s with hard drives and it was the quality of visitors which really made the show. New York obviously likes AmiExpo. It's a bit of a shame I wasn't keen on New York.

The new version of the Exec documentation. It will be here in Jun

Rupert Goodwins looks at a utility to provide you with a broader palette

LVERYONE knows that the Amiga can display, 4,096 colours, but it's hard to credit, looking at the vivid orange, china blue and Dax whiteness of the normal Workbench display. There's no hint in the Amiga manulas as to how such dayglo diversity might be obtained. It seems that you are expected to be happy with just the four that

Commodore gave you.
This is silly. At least, H Tension
thinks so, as it has brought out Icon
Paint to warm up the Workbench and
give you the power to iconise your
own programs. Icon Paint is really a
set of programs which can switch the
Workbench between 2, 4, 8 or 16
colours, create, cell or import icon
images, and generally give Amy a
fresh coat of makeup.

Booting from the Icon Paint disc

gives an immediate indication of what is in store. The Workbench is switched into 16 colour mode, with several subdued colours mixed with several subdued colours mixed with shades of grey – very attractive. The disc icon looks like a solid 3.5 in floppy and double-clicking on it draws the metal shutter back to reveal a realistic disc surface. There really should be a sampled sound effect to go with that.

The Icon Paint window is dominated by the icon of the editor package. Below that are various other icons for the new programs provided, as well as buttons to switch the number of colours in use. HI Tension has redone most of the standard workbench icons, and hidden away on the disc are a number of impressive multicolour pictures, as much there to show what can be done as to be serious alternatives.

The editor package is the largest program on the disc. It has two windows, in which icons up to 320 by 100 pixels can be edited. One window is for the "normal" icon, the other for the icon after it has been selected.

The editor is, for a world satiated by PixelPaint and awaiting Deluxe Paint III, rather crude. There are gadgets to fill an area with solid colour, type in text, draw lines, boxes and circles and not much else. The magnify function works rather slowly, and it gets unusable if you draw on the main screen over the area being magnified.

But all this doesn't matter, because the program will load and clip to size any IFF picture file. You can mess around with your picture to your 4

heart's content in your favourite graphics utility, and turn it into an icon when you're quite happy.

Those with video digitisers can capture their favourite rock stars, scale them to fit and get them to stick their tongues out when the icon's selected. Just don't ask me why.

The editor allows you to set what sort of file will be associated with the icon when it's finished. Task is used for programs, Project for files which contain data for programs, and so on. It's a neat way of providing programs you use with their own icon and a presence on the Workbench screen.

Other programs are included to smooth the introduction of this chromatic extravaganza. One is a palette program which sets up the colours just so. There's another, called Dircol, which lets each Workbench draw have its own colour settings by loading information from a colour map file. Finally, there's Getool, which

extracts colour information from any IFF image file – though not a HAM image. You want a HAM Workbench? You write it! Between them, they more than compensate for the Preferences program only controlling the four standard Workbench colours.

There are also a couple of utility programs to create a second Workbench or kill one off. I'd have preferred to have been able to load an IFF picture as a backdrop to the main Workbench – I've seen some PD software on an early Fish disc that does this, and it would have added a nice touch.

nice touch.

At first I had considerable problems with Icon Paint. Icons on old discs consistently corrupted the screen, crashed the computer or left droppings all over the place. A quick phone call to H! Tension revealed that I hadn't read the Readble file (case a 16 colour reviewer's above and on the place of the portain Giru colour Workbeach this didn't matter. Throw them at the 18 colour version and

things break down.

The cure is to load the icons into the editor and save them out again. This works in all the cases I tried – I couldn't resist the temptation to modify the pilot's head in Interceptor and stick a smiley on his helmet.

There was still the occasional odd

Read.He Bircol Falette
C2 ReadB CLI

Subtle shading is often more effective than vivid colours

The software comes with a range of icons

corruption on screen; whether this was from an icon I'd missed or some deeper malaise I'm not sure. Whatever, it wasn't nearly nasty enough to rouse me to investigate further.

The documentation was adequate, apart from using "it's" for "its" throughout. The biggest annoyance of the whole setup was the copy protection – there are no restrictions on the number of times you can make backups, but whenever you want to use the editor you need to have the original disc to hand, otherwise the program won't run.

It's not the sort of thing you do to a utility which people might buy to make their livings from. Not to mention the annoyance it causes to hard disc owners.

Icon Paint lets you choose between speed and beauty on your Amiga. A two colour Workbench is faster for text painting and window movements and uses less chip memory: a 16 colour version is slower and hungrier, but looks so nice. Altogether a worthwhile utility.

### REPORT CARD

Product Icon Paint Supplier Hi Tension Price £14.95

While a prettier Workbench is very nice it isn't really any great use.

When you have conquered the problems caused by buggy icons it is simple.

VALUE
There are few games you can buy for less than £20, so a utility at this price really is a bargain.

OVERALL 57
Saved by the price, a fun, frivolous utility, but it is quite cute.

The above is just a small selection of our VAST stock of AMIGA software Callers welcome; Normal Office Hours - 24 Hour Telephone Service!

Cheque, postal orders or credit card facilities are available

Four years' continual development have made MicroLink into the COMPLETE communications and information system for everyone with a home or business computer.

And it's so easy to use. From your keyboard, linked to a modem and phone, you can directly key into the services shown above - and many, many more.

Every day thousands of electronic mail messages pass between MicroLink subscribers throughout Britain . . . and many other parts of the world. From their keyboard they can also send telex and fax messages, without the need to buy expensive equipment.

MicroLink can be used with ANY computer, from a tiny hand-held Psion Organiser or Z88 portable to the most sophisticated computer of all. And from anywhere where there is a telephone point.

So if you want to speed up your mail, tap into a weather satellite, carry out company searches, obtain free legal and financial advice, order flowers, book theatre tickets, negotiate a mortgage, help yourself to free telesoftware programs - or go adventuring in the land of Shades, the world's biggest multi-user game then there's only one answer - MicroLink.

One number to dial one security password one simple log-on and you're only a keystroke away from the best information and entertainment services now available!

# What's up, Doc?

John Kennedy finds that animating Bugs Bunny is as easy as chewing a carrot, provided you've the memory the Amiga, mostly through short animated demo programs and the occasional appearance on a Channel 4 music programme. The blitter, the large choice of colours and an overscan mode whereby the whole screen is used with no borders makes it the ideal, chaps way to produce professional looking results. However to achieve anything that

However to achieve anything that looks in the less part useful you would first need to spend a lot of time learning machine code and reading volumes 1 to X of the Amiga hardware specification. Realising this, several software companies have released packages that do all the programming – you just supply the ideas and the drawings. MovieSetter

The Event menu allows you to change the film's colours and timing

4

claims to be the first wysiwyg animation program for the Amiga. It comes in a large box on two non copy-protected discs with a 68 page manual. It claims to need only an A500 with no bolt-on memory or extra drives to run.

Now I am no artist – drawing the curtains is large enough strain for me – so I must be the ideal person to test an animation program. If I can achieve anyuning worthwhile, it must be good.

The disc auto-boots and leaves you on a Workbench Clicking open the disc reveals several icons including MovieSetter, ScreenEditor, SetEditor and MoviePlay. The last is a freely distributable program that will play your finished animations. This means you can give all your friends copies of your epic productions without breaking any copyright laws. I wanted to keep my friends, so I kept my animations to myself.

OVIESETTER brings its own set of jargon, unavoidable with a program of this complexity. In some cases the choice of words leaves a lot to be desired because they might easily confuse the beginner.

The word set is used very frequently but not, as you might expect, to describe the environment in which the movie takes place. Instead, a set is a collection of faces, and faces are all the possible drawings of a particular object. Thus the SetDesigner program allows you to

edit the actual characters and objects you wish to animate.

A NIMATIONS are created by all your characters.

Every possible position that the

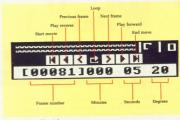

Every possible position that the character can be in must be defined. If you are animating a man walking, you must make several drawings, each with his legs in a different position. If you are designing a stationary object, say a lamp post, you

stationary object, say a lamp post, you need only draw it once. When the drawings are finished, ScreenEditor must be selected to get down to the business of creating your

First you choose the background

that your objects will appear in front of. The way in which this background appears can be chosen from a such control of the property of the p

from. The backgrounds can be scrolled horizontally or verifically. You can specify an acceleration if you want, so the background will start to move slowly and then build up speed. As the manual points out, this mimics real life, where things start slowly, then increase speed. To allow your

The controls are pukka windows

The otory board mindem can be to the

animations to move you must lay down tracks for the drawings to follow. After selecting New Track you must choose one of your previously defined sets. When this has been loaded, the pointer is replaced by the first drawing in the set. Clicking the mouse button will fix the face at the position. The face at the pointer is incremented automatically, so the incremented automatically, so the next drawing appears, ready for positioning.

A LL objects remain displayed as you lay them down, making positioning easier. This procedure is repeated, perhaps using a another set and track, until your animation is complete. At any time you can

Insert element before

Change face

preview the film to see how things are going.

SetDesigner is the part of the program where the hard work in the form of drawing is done. All the features of a standard art package are here – zoom, cut and paste, airbrushes and so on. No tweening is done for you by the program, you must redraw every stage of movement yourself.

You can copy details from one drawing to another, which makes things much easier, especially if only a small part of the drawing changes – if the eyes of an object blink, for example. Pictures in IFF format can be loaded and saved, so you can use DPaint or similar if you prefer.

The sound options are impressive and a doddle to use. You select a sound from the menu, choose the pitch using a short section of a piano keyboard and then move through your film until you reach the right moment to play it.

OUND can be selected anywhere in the stereo image by use of the pan slider. A bouncing ball could make a ping sound on the left channel as it hits the left-hand side of the screen and a pong sound on the right channel when it hits the opposite side. Although not wildly useful, it is a nice touch.

Where this section of MovieSetter falls down is with the appalling selection of sounds supplied. Most

### More memory less restrictions

EMORY restrictions are improved to work with a standard 512k – the demonstration film supplied was created on such a set-up. This film only lasts for 10 seconds and does nothing amazing, which says it all: You can use the program with no add-on memory, but not to do anything worthwhile.

The length of your film depends on many factors: The number of different objects, the number of sounds used, the number of these, the number of those. With 1 meg you can use the

actual MovieSetter program, a combination of SetEditor, ScreenEditor and MoviePlay. Using MovieSetter with only 512k means being forced to use a monochrome display – not a good thing because all the example art is colour. All the programs in memory at

once means you can have several windows from each program opened at the same time, which simplifies things somewhat. A Storyboard option is also

available with extra memory. This will produce a series of miniature representations of your film with each drawing coming from a specific, user-defined event. An event could be each background change or each sound effect.

appear to be nothing more than simple clicks and grunts. There was a splendid chance to use the wonderful sounds used in the old Tom and Jerry cartoons - the gasp or scream when Tom's eyes popped out of his head, that sort of thing. Instead we get a "twok" sound made by flicking the sampling microphone with a ruler. Pity.

OCUMENTATION is thorough and includes a tutorial section to help build up a movie from scratch. The best bit must be a short flickbook cartoon, made up by putting lots of drawings made, presumably, with MovieSetter in the

top right-hand corner of every page. Extra documentation is supplied as a text file in the MovieSetter window and clicking on it will produce streams of information that has been left out of the manual, most of it

DATAPLEX HARD DRIVES

478.00

20Mb Drive AS00/1000 80Mb Drive AS00/1000

concerning A500 owners with no extra memory - exactly the people who would want to read the

information straightaway, not find it lurking on disc. Bad show, this Moviesetter needs both a memory

expansion and a drawing program that creates IFF screen files to be used to its fullest. There is no way to create your own backgrounds from within the program, leaving you with the three demo ones to choose from.

Although a disc is supplied containing nothing but example drawings and animations to use, these are all quite limited and none will help create graphics for business

presentations And when it comes to producing a finished film, the dreadful sound effects and absence of speech bubbles will mean it is an almost completely

silent affair

Although computers have come a long way since the humble ZX81's 64 x 40 monochrome graphics, the prospect of creating your own full colour cartoon is still a long way off.

MovieSetter comes close, but not close enough to convince my mother she's watching television. Nice try, though.

no other program can. Rupert Goodwins asks if it is worth adding to the Chopin Liszt

# Ariadne Software's new Opus music composition language A knight at the opera

LOYD WEBBER made it, Bach did it four different ways at once and even Kylie Minogue is rumoured to have heard about it. Music has been big business for a long time. The Amiga, being a musical machine, knows all about it and has some harmonic hardware to generate the stuff. But even sonic silicon needs software to make music. Opus 1, from Ariadne, is that sort of software.

There's lots of Amiga music software - Deluxe Music Construction Set, Sonix, Soundtracker, Soundscape and more. The Amiga, also a graphical machine, encourages its software to be pretty, and since music is normally written as blobs on lines most Amiga music software spends a lot of time picking up blobs and plonking them down on lines. Rather like writing a book with a word processor, it's very easy to make changes, add bits and move stuff around. However, there's more to writing music than words.

A magazine article like this is an almost random collection of words There are rules of grammar, but if the writer wants to put in a word like gherkin there's no reason why not. It doesn't make the English any worse.

Music is structured; some parts repeat for a fixed number of times, others change as the piece progresses. They have a mathematical relationship between themselves and the time since the piece began. Dropping in a random phrase is certain to make things worse. It's like a computer program.

NLIKE Instant Music or Deluxe Music Construction Set. Opus isn't a music editor. It's a programming language, or more accurately a music composition

nothing to do with Polish - it's named after the mathematician who invented it - it is all to do with giving the computer the data it needs before telling it what to do with it. Computers like this; humans, alas, don't. Instead of saying 'Play bongos 100 times', the command is 100

Bongos Play. It isn't difficult to

understand, eventually,

Because of RPN, and because of the way commands are built up out of existing ones, it is very difficult to write an Opus program by just feeding in the instructions as you would with Basic Instead, the program is written as a document in

Ed. or Scribble!, or whatever, Once it all seems likely to work, it is passed to Opus, which compiles it, At this point any errors in syntax, or missing commands, are spotted and the programmer/musician edits the text again.

EVELOPING the code takes a while. When the program compiles the computer displays the main tracks of music. Tracks are the almost final stage of music generation - lists of notes, instrument changes,

dynamic effects (volume, crescendos and so on) and everything else that an individual line of music in a song

does. The tracks are displayed on a stave in traditional format with a few extra bits to let the programmer know what instrument is selected, which bits are repeated and so on

No editing takes place here - if a note is out of place or a phrase needs changing then it's back to the text editor to modify the program. recompile and review the track. This sounds hard work, and there's no denying that it takes some learning. especially if you are not familiar with developing a compiled program

The Onus program displays a screen with three main components. At the top is a status window which shows current file details as well as information about the amount of memory being used. Below is the main display window. All of Opus' output appears here - errors from the compiler, listings, the lot. At the bottom is the control window, with a set of buttons which are used to

### An Opus score

(\* Bach Chorale Prelude on In Dulci Jubilo \*) (\* This sounds nice if you alter the instruments to avariety of Midi presets \*)

language, an MCL. To make it

produce music, you have to feed it a

program, written like any other in a plain text editing program; it then

compiles that into a data file which it

- or another program - plays. No

music, is the interesting part. The

infamous tongue designed to control

radio telescopes. It has found a much

wider audience among technical and

- a little Forth can do a lot of work very quickly - and cryptic.

commands out of lists of old ones, in

the same way that a piece of music is

built out of lots of little bits of music.

Which is why Onus is like Forth, and

why a lot of people will be put off

Reverse Polish Notation, RPN is

before they even start looking at the

package. And that would be a shame.

Perhaps the most arduous part of learning Opus is getting to grips with

low level programmers, its main features being that it is very powerful

It works by building new

picking up, no plonking down, The first step, programming the

Opus language is like another

computer language. Forth, an

1000 owners do not have this feature. Experienced programmers and mouse haters might prefer the interactive option. A button switches

control the compiler. To start with you have to set up input and output files before Opus will even consider compiling a program. The buttons bring up a standard list of files from directories called Text and SMUS, the Amiga standard music file format. Normally you pick the program you want to compile as input from the list in the normal way. The same mechanism is used to choose the output file.

ORKING backwards has obviously become ingrained in the programmer's soul. Choosing an output file would normally be simple, either automatically generated from the input filename or just typed in. With Opus the output filename stays until explicitly changed. If you pick a new input file and forget to change the output the old output file will be lost. This happened to me, embarrassingly more than once.

There are other oddities on the control panel. Some of the buttons toggle between two states; save off switches to save on, and this controls whether to automatically save the output file once it's compiled However, when automatic save is on the button shows save off and vice versa

Likewise the compiler can display the part of the program it's currently dealing with; there's a button marked text on or text off to control this. When text is displayed, the button is marked text off. There is a kind of logic in this, but it's unlike any other Amiga program that I've seen

Other buttons include Words. which shows all the commands Opus knows about, Compile, Edit and Play, which do the obvious. Filter which turns the Amiga's internal sound filtering (and the power LED) on and off and Quit, which finishes Opus and returns to the Workbench.

Amiga's audio output. With it on find in the directory assigned to music sounds muffled but clean: Instruments. The three zeros are part when the filter's off, the music sounds of the smus definition and are used if much brighter but with some odd a link to Midi is needed instead of a noises thrown in. You might have sampled instrument or for other noticed that some games turn the special purposes. The final power LED off. This isn't for the fun "instrument" tells Opus to take the of it - the music sound better. Amiga data and load it as an instrument -RPN, remember? In a Basicish language, the equivalent command

would be instrument-cello.0.0.0 Then come the tracks. The word

7/4 6/4 kC) 8 9/8 6/8 10 kG kC 9/8 6/8 3/8 2/4 6/4 5/4 4/4

off the control window and leaves you at a prompt in the Interactive window. Here Opus commands can be typed in directly. It's a good idea to leave this until at least one program has been written and got working with the help of the control window. The Help button produces several screenfuls of online help, as might be expected, but it's not terribly

Once a program is compiled and saved, either the main program's player - which has a dandy little display of notes playing for all four channels - or the stand-alone. displayless but very fast player can be used to turn all that hard work into beautiful melodies.

language is incomprehensible, but

behind it. The first items in a program

are usually the instrument definitions.

in the form {cello 0 0 0 }instrument

The cello is the name of the IFF

instrument which Opus expects to

NITIALLY the programming

a little inspection reveals the logic

that the following words should be compiled into a list, not just analysed and left till later. The lists of notes are kept within curly braces { and }, and begin with a word that will be used later to refer to the whole list. So the list { nasty 4 4 t/s cello !4 4;a b c a/ f# a } would sound awful (believe me), but could be included in a song later by something like 100 ( nasty ) which would play nasty 100 times The various parts of the list are 4 4

TRACKS is used to tell the computer

t/s - set the time signature to 4/4. cello - use the cello instrument, !4 use crochets, 4: - use octave 4, a b c a/ f# a - play the notes a, b, c, a flat, f sharp and a. If you don't know what a time signature is, and think crotchets are a kind of snack, then the chances are that Opus is not for you.

Of course, if you don't like to use 4 4 t/s to set the time signature you can always define a new word to use in its place, like { common\_time 4 4 t/s }. But you have to define words before you can use them. Although Opus generates standard

IFF smus files, which can then be

played on any music player program, it has a file structure of its own which caters for the many extra features that Opus supports but that aren't in the smus definition. For example, if you want a bit of music repeated 1,000 times then the smus file has to have the bit of music repeated 1,000 times. The Opus file definition - OPX1 -

just has the instruction to repeat 1,000 times in front of the bit of music.

This can result in some extraordinary savings in file size and since each bit of music can have its own loops inside it is possible to produce a piece that will fit on a floppy but will play for longer than the Universe will survive. As the manual says, that's a sobering thought...

Other tricks in the Opus repertoire include repeating a loop until another bit of the music is finished, sending pitchbend and aftertouch information to the Midi channels in order to slide notes, adding vibrato and other effects to a note after it's been struck and randomly choosing between options. The word Break will wind down a complex series of loops in a controlled fashion, useful for those into weird, polyrhythmic music,

All the things that aren't capable of being expressed in normal smus format are included in a small subset of extensions. The idea is that the format is 99 per cent smus and existing players can be modified quickly to cope with the flood of OPX1 format music which is, Ariadne hopes, about to flood the market

Opus-1 needs at least a megabyte to work with. It comes with Opus- 512, which foregoes some of the posh features of Opus-1 (online help. control panel) to give the unexpanded A500 a bite of the cherry, but since the program is properly written and can merrily multitask, people with more ram get more fun.

There are a couple of extra

programs in the package, one to capture Midi information from a keyboard and turn it into an Opus source file - so it can be edited. transposed, cleaned up, and so on and one called Performance which is much more interesting. It plays music, and lets you play along on a Midi keyboard.

Once you're happy with what you've got, you can mix it into the main track and play another line. It's multitracking; limited but - Ariadne dangerously admits in the documentation - a pointer to what's going to happen to future Opera.

RANTED Opus is a programming language. But does it sound any good? Since it plays sampled sounds, in theory it should sound no better and no worse than the rest. But in terms of what it can do with the samples, it is orders of magnitude more flexible than the competition

People with a serious fondness for producing music will be able to use Opus to wipe out the rest. But the prospective Opus owner must know at least the basics of music theory, be prepared to program, and to brave the eccentricities of the Ariadne user interface philosophy, which is only slightly less impenetrable than Zen Buddhism.

I can see this program justifying the purchase of an Amiga for a music laboratory in a university or polytechnic. Likewise, anyone who knows their chromatics from their arpeggios and is fond of Philip Glass

shouldn't hesitate before taking the plunge. But the new muso, or those who have problems programming their video, should stick to the other, graphic-based programs. In fact, one of those would make a good companion to Opus.

Wishlist? Well, it would be nice, given all the support that exists for experimental music in the package not to be limited to Western scales but to include Eastern and microtonal options (I only want the world). And there are plenty of rough edges which put Opus in a needlessly bad light against other, swisher packages. But Opus does things with music that other programs can't.

My neighbours are going to hate Ariadne.

OPIIS.1 Ariadne Software

£99.95

EASE OF USE .... This is a programming language. No compiler is going to be easy to use if it is to be powerful and flexible.

SPEED. Does not hog the processor while vo are multi-tasking. This is a properly written suite of Amiga programs.

Opus is pretty expensive for a music

program - good value for a language

There are some things that no other music program will do. It's not for the novice muso or programmer but is an incredible musical tool

# **FUNKY**

AVE you read the explanation of DEF FN in the AmigaBasic manual? Bit heavy, isn't if? And it doesn't even skim the surface. A doesn't even skim the surface has not to the next keyword, yet functions are really rather simple. Without resorting to counting, I would guess that over half the keywords in AmigaBasic are functions.

You can spot them a mile off because the keyword is always preceded by an equals sign. For example,

(a) what\$=INKEY\$
(b) guess=RND
(c) value=PFFK(188

(c) value=PEEK(188)

Another thing all functions have in

common is that they return a value of some type. But be it floating point, integer or string, a function will only return a single value. In example (a) the function INKEY\$

is called and the string value returned from the function is assigned to the variable whats. In example (b) the function RND is called and the variable guess is given the floating point value which returns. In example (c) the function PEEK is called, which introduces us to an important concept of functions, the parameter.

Most functions need to be supplied with at least one parameter, and it is always given in round brackets directly following the function name. In this case, the function of PEEK is to look at a memory location and return the one byte integer value it finds where to look, and that is what the [100] in example [c] is, the memory address we want PEEK to investigate.

So let's define ourselves a simple little function to do something mildly useful – to pick a random whole number between zero and 10:

DEF FNrandom = CINT(RND\*18)

The name after FN, in this case random, is supplied by your good self

# **FUNCTIONS**

### Jeff Walker delves deeper into AmigaBasic

and follows the same rules as for variable names: It must start with a letter, can include numbers and fullstops, can be up to 40 characters in length, mustn't be an AmigaBasic keyword and can be followed by one of five symbols – %, &. !. #, \$ — to signify which type of function it is.

Once our function has been defined we can use it almost as if it is a new AmigaBasic keyword. Listing I is a simplified view of it. In practice you would be assigning the value returned by FNrandom to a variable. Something like:

### number = FMrandom

Right. Before we go any further we must learn a very important rule about using defined functions, which is that the function must have been defined before calling it for the first

The best way to do this is to put all your DEF FN statements in one initialising subroutine, like Initialise in Listing I, and make the first line of your program GOSUB to that subroutine. If you always do it this way you will never have problems—tryping mistakes apart—with

Start: 60SUB Initialise.variables 60SUB Print.random.numbers

Print.random.numbers: PRINT FNrandom FOR delay=1 TO 198:NEXT GOTO Print.random.numbers

Initialise.variables: DEF FNrandom = CINT(RND\*1fl) PETHON

### Listing I

Undefined user function error messages.

Oh yes, and unless you are really

pushed for memory – which isn't at all difficult with barely 25k to play with (curse you, MicroSoft) – never redefine a function to do something else. It creates confusion and bugs.

There is no restriction on the number of functions you can define, so if you need a function to do a different job, define a new one with a fresh name in your initialising subroutine instead of re-using an old function name that you know has no further use in your program.

further use in your program.

OK. Getting back to the programming, FNrandom would be programming, FNrandom the decible in the range department. In other words, instead of letting it pick a number in the programming of the

### DEF FMrandom(x) = CINT(RND\*x)

The (x) after FNrandom means we will have to supply a parameter when we call the function. The actual variable name x is arbitrary. By that I mean it could be a, b, HumptyDumpty. or whatever.

HATEVER variable name you use in brackets on the lefthand side of the definition, he same variable name should appear somewhere on the right-hand side because it will be used temporarily to hold the supplied parameter while the function works on it. In this case the variable appears on the right-hand side in the calculation RND's.

Whatever you call your variable, its name and value will always be local to the function it is defined in. That means that if you have another variable of the same name elsewhere in the program it will be unaffected by the function. The simple example in Listing II illustrates this local variable concept better than a

thousand words.

If you run the program you'll see that the value of x, set up in the line labelled ValueX, remains constant at 999 even though we use x in the line labelled Define as the variable to hold the parameter passed to the function.

ValueX: x=999 605UB PrintX 605UB PrintX 605UB PrintX Choose: picked = FWrandom(SB) PRINT \*PICKED \*\*;picked 605UB PrintX

END
PrintX: PRINT "X =";x:RETURN
Listing II

which is called in the line labelled

If you study the line labelled Choose you'll see how a parameter is passed to the function. In this case the parameter is the number 50, but it could just as well be a number variable of any name – including x if you want to be literal about it. It could even be a long calculation like:

### picked = FNrandom(guess\*4+2\*total/3)

As long as what is between the outermost brackets evaluates to a legal return value for the function, the calculation can be as weird or complicated as you like. For instance, you could use a function as a parameter.

### picked = FNrandom(FNrandom(188))

which would be perfectly legal. A line like that would first pick a random number between zero and 100 - say 67 - then pick a random number between zero and 67, then pass that value back to the variable nicked.

EMEMBER, however, that defined functions can't access variables in the program proper, they can only work on variables you've passed to the function as parameters.

And you don't have to stop at single parameters, you can have as many as you like. We could extend the portability of FNrandom further so that both the top and bottom of the range are supplied as parameters

In Listing III you supply the number range as the lower and upper limit inclusive, separated by a comma. The example picks 15 random numbers between and including 100 to 200. You've got to

admit that picked = FWrandom(188,288)

is far more readable than:

picked = CINT(RND\*(200-100))+100

SO far we've only looked at functions that return numbers, but we can also define functions to return strings. The principle is exactly the same, except that you should suffix the function name with a dollar sign. Thus, if you defined a function FNIfS as:

OFF FNIfs(x) = STRINGS(x,CHRS(18))

and then executed a line like:

PRINT FNLfs(25);

you would get 25 linefeeds printed, scrolling whatever text was on the screen up through the top of the window, giving you a slow but fancy CLS. The number in brackets after FNIfS is the number of linefeeds that

will be printed. Again, that's a simplified example, but you can do clever things like defining a function to split someone's forename from their surname and capitalise the first letter of each. Which is what Listing IV does.

AKE special note of the use of FNfname\$ and FNIname\$ as parameters for FNcapit\$ in the final two lines of that listing. I'll leave you to wade through the logic of the string slicing in the DEF FN statements on your own. Paracetamol will help, although you should be

experts on strings after last month's article.

Although the function itself is of a certain type, the parameters you pass can be of a different type, or even of mixed types. As an example, here's a function that will pad out a string with a programmer-defined character to a programmer-defined length:

DFF FWnadleftS(textS.charS.size) = S TRINGS(size-LEN(text\$),char\$)+text\$

Watch the wrap. Don't press Return after = S, type the whole thing into the List window as one line. Notice that the function itself, FNpadlefts. is a string function, but the parameters are of both string (text\$, char\$) and number (size) type. You can test it out by adding another line:

PRINT FNpadleft\$("Fred","\*',18)

which should print six stars followed by the word Fred.

INALLY this month, we've seen how defined functions can use themselves or other functions as parameters, and although you can also use other defined functions in a function definition - which is totally mind-blowing and something you ought to experiment with because it's better than a cold shower in the morning - you can't use recursion with functions. In other words, a defined function can't call itself from within a function definition.

Confused? You will be. Try this:

DEF FWhalf(x) = FWhalf(x) PRINT FWhalf(188)

OK. logic tells you this is wrong anyway; it is merely a quick example of what happens. The program stops with an Out of memory error message. What's amazing is that the error message is correct. Yes, all 25k of AmigaBasic user memory has been used up by this tiny program. How? Well, it's due to something called stack overflow, which is another subject and a good way to end an article on defined functions. Byeee.

Start: RANDOMIZE TIMER 60SUB Initialise FOR Loop=1 TO 15 GOSUB Pick.number ' Pick a number, GOSUB Show.picked ' print it, NEXT Loop

' Set the seed for RND. ' Define the function. Do the next bit 15 times. if Loop<16 do it again. 'Otherwise finish.

Pick.number: picked=FNrandom(188,288):RETURN

Show.picked: PRINT picked;:RETURN Initialise: DEF FMrandom(lo,hi)=CINT(RND\*(hi-lo))+lo:RETURN

Listing III

DEF FMfnameS(xS) = LEFTS(xS,1)+MIDS(xS,2,INSTR(xS,'')-2) DEF FNIname\$(x\$) = RIGHT\$(x\$,LEN(x\$)-INSTR(x\$,"")) DEF FNcapit\$(x\$) = UCASE\$(LEFT\$(x\$,1))+RIGHT\$(x\$,LEN(x\$)-1)

IMPUT "Enter forename lastname: ",fullnameS:PRINT

PRINT "Forename = ";FNcapitS(FNfnameS(fullnameS))
PRINT "(astname = ";FNcapitS(FNlnameS(fullnameS))

Listing IV

Commodore computers are making major inroads into the world of professional and business applications - as you can see for yourself at the Commodore Computer Show. On more than 100 stands you'll find the very latest in desktop publishing software, presentation graphics. desktop video, communications, computer graphics and a whole lot more besides - not forgetting the ever-growing range of innovative entertainment software for when you need to unwind.

With special events, presentations and an advice stand, the Commodore Show is the place to go - whatever your interests.

PRESTEL ORDERS

Discover new ways

FREQUENT mentions of exotic fruits in computer articles is prohibited by the EC directive for the EC directive for

Last time, the idea of subroutines was spotted on the sonar. Subroutines are chunks of code that have a specific purpose, almost little programs in their own right. These are very useful for several reasons. First, and most importantly, they prevent that curse of the coding classes: Finger Wear And Brain Fade.

FWABF is well known to the medical profession; the sufferer has his digits permanently curved in the typing position and his brain locked in an endless loop considering his program complexity. It's nasty, but avoidable.

Asy that you want to get your Amiga to squeak like a coypu at various times during a program – when a user types in the wrong thing, for example, or when your animated aardvark collides with a motionless

You could work out the instructions to make the noise and put them in the program at every point they're required, but it's far simpler to make the squeak a subroutine and call it by

a JSR (Jump to Subroutine) each time. Not only does this save typing, it makes the code smaller. The only disadvantage is that it's slightly slower – the processor has to execute a JSR and an RTS (ReTurn from Subroutine) each time which wouldn't otherwise be there. But that's only two more instructions, and it's very rare that speed is so important that subroutines have to be abandoned in favour of repeating the instructions. That particular trick is called inline code, by the way.

There are more advantages. First, iyou want to change anything you only have to look in one place; anything which means you have to go through mountains of listings usually mean you'll miss things and make mistakes. Secondly it's easier to catch bugs, for the same reason. It also makes it easier to have one squeak routine that can be used in many programs— the generation of sets of

# Stacks and sub

Machine code programs can be made to run faster by splitting the routines into modules and using stacks in place of registers. Rupert Goodwins explains useful bits that can be plugged into new programming projects is called building up a library, and it is something all professional

programmers do. Helps prevent FWARE

Lastly, it makes a program easier to understand, since a ISR covpu-calling in the code is self-explanatory. The trick lies in deciding when and where to employ subroutines; if you're often copying strings around memory it's worth having the string copy code as a subroutine, but if you only do it once then the overhead might not be worth it

Subroutines can - and often do call other subroutines; that coypu code would most likely set up an area of memory to sound like a large, water-living rodent and then call another subroutine that just took an

effects. A stack is an area of memory which is used for storing temporary data, but since it's the sort of data which is very important to the processor - register contents. addresses for subroutines to return to and so on - there are special mechanisms which provide fast acress to it

Stacks on the 68000 are more complex than with most other processors, since there are various ways to use the things.

The stack's address is normally pointed to by a special register called the stack pointer - if you wanted imagination, you should have gone into basketweaving. The 68000 doesn't have a register that's called the stack pointer; instead it uses the address register A7 to do its dirty work

There are actually two A7s within the dark recesses of the processor is in user mode, and

the other when it's in supervisor powerful, and tends to be reserved for

mode. This last mode is more use by the operating system which has to control what programs get what memory.

NE effect of this is to give the supervisor mode a senarate stack. Another is to prevent A7 from being used as just another register - if you do this, it's the equivalent of wrapping your chips in the roadmap.

Things are written to the stack in three ways. The first is done automatically by the processor when it comes across a subroutine call. A ISR, makes it subtract eight bytes (a longword) from A7, since that's the amount of memory needed to store an address

It takes the address of the instruction that follows it and sticks it in the area of memory pointed to by A7. Then it jumps to the new address specified by the ISR. A7 now points to spare memory, which the subroutine can use if it wants

When the processor comes across the RTS instruction later it adds eight bytes to A7 and reads in the data at that address. This data was the address following the JSR instruction, so the processor loads it into the

program counter and carries on Since it doesn't care what happens to the data on the stack now, the program can reuse the stack memory. But, while the processor was executing the subroutine it did care about keeping the return address safe, so by subtracting a longword from A7 it stopped anything else from overwriting it.

This only works, of course, because everything follows the same rules. Put something on the stack, subtract the length of whatever it is from A7. Take something off, then add the length to A7. As the stack gets used, it grows down through memory, as information is removed, it shrinks upwards again.

The second way of putting stuff on the stack is by using the normal MOVE instruction. If a subroutine wants to use registers D0, D1 and A4, it can save the old contents by the following:

MOVE. L DO .- (A7) MOVE. L D1,-(A7) MOVE.L A4,-(A7)

Here the subroutine does evil things to the registers

> MOVE.L (A7)+,A4 MOVE.L (A7)+,01

Note the use of those awfully useful increment and decrement fixes to make the saving and loading of registers nice and short. Also note the obvious - once you know about it fact that stack items are removed in the opposite order they are put on. It might seem natural to remove D0.D1 and A4 from the stack in that order. but it would result in the original value of D0 ending up in A4, and vice

It might be becoming obvious why the stack is a place for introducing subtle bugs - the program that called the subroutine might not check A4 or Do for a while after it calls the subroutine, so the real cause of the error would be lost in the mists of CPII time

Other things that can go wrong with the stack include removing less than you put on, or more - it really doesn't matter which. Either way, when the final RTS turns up, the processor will remove the incorrect return address from the stack and blithely do a BDB, or Branch Dim Beyond. You the programmer will observe a machine apparently

# broutines within the d recesse of the - one is switched in

area of memory and made a noise with it.

The second subroutine would also be used by others, like the one that said "Game Over". Again, the right choice of subroutines makes the programming easier, and is a large part of the process of software design.

There are problems with subroutines; they make nests beneath the floorboards and steal cheese. Also, they - like any other useful bit of code - have to use registers to do their thing. But at the point in the code where you call a subroutine, you might be using the same registers for something else.

Since having to make sure that you knew what subroutines used what register before you could use them would promote FWABF, it's a good idea to save the contents of whatever registers will be used in a subroutine at the beginning, and restore them later. And the 68K, like most other microprocessors, has just the place for them - the stack

ROGRAMMERS have a love/hate relationship with their stacks. They're useful, convenient but tend to take on a life of their own and unless controlled, cause interesting side

AMCS

possessed by a demon; experience is the only way of preventing this.

There is a quick way of putting whole scads of registers on the stack, and pulling them off again afterwards. This involves a new variant of the MOVE instruction -

### MOVEM, or Move Multiple. So, the MOVEM.L DO-02/AB.-(A7)

instruction:

will stick Do, D2 and A0 on to the stack and adjust A7 accordingly. At the end:

### MOVEM.L (A7)+,08-02/A8

will put everything back again. This is a bit slower than one ordinary MOVE instruction, but quicker than about three. So, if you have to keep three or more registers safe and sound across a subroutine, MOVEM is your hest het

Using the stack in this way is quite slow in relation to other machine code instructions, and whereas it's safest just to save registers, significant increases in speed can be had by being very selective about what gets saved and what gets sacrificed

Obviously, if a program's got a fixed number in A5 it's quicker just to reload it after a subroutine than to expect the subroutine to carefully store it on the stack and replace it afterwards

But maybe you want to use the same subroutine elsewhere where A5 has more important data; again, this comes down to designing the program properly in the first place and balancing speed against

efficiency and ease of programming. The third way of using the stack is a little odd, and involves the PEA instruction. Luckily there is a specific exemption for this in the EC directive, otherwise it would have to be called the GERBIL instruction. PEA stands for (no jokes about standing for a

PEA, please) Push Effective Address Most processors - but not the 68k have special instructions for saving stuff on the stack called PUSH and POP. Since the 68k can use its ordinary MOVEs for stack operations, the only place where PUSHing comes in is with this. PEA takes an address and puts it on the stack. It's similar to what the processor does with JSR but you get to define the address how you like and the processor doesn't attempt to jump anywhere afterwards. PEA isn't overworked: It can be

used to set up false return addresses from subroutines or to put parameters

on the stack before a RTS. Passing parameters on the stack is an advanced technique. It's very useful when interfacing machine code routines to high level languages like C or Basic, and also for any situation where you want to pass information to a subroutine but there aren't

enough spare registers. It works by putting all the data on the stack before doing the JSR. The subroutine knows that there is a longword of address data on the stack and that after that it can find its data. so it loads the value of A7 into a spare address register, adds eight (for example - if it's saved some registers on the stack already it might add more) and can then get at the data by using this new address register

At the end it can put results back in the same place - providing there's enough room, if not the calling program has to leave some extra space on the stack before doing the ISR - before restoring the old value of the address register that it used and doing an RTS

The reason for going to all this bother is that, since the data is kept on the stack, it doesn't take up any permanent place in memory and it can be reused without any FWABF. Also since the stack grows and keeps whatever's on it safe and sound, the routine can call itself without overwriting anything important. This

completely bonkers - why would any routine want to call itself? HERE are lots of reasons. Imagine that every second you want to do 10 things. Every second you call a routine that does these 10

things. One might be "if the giraffe's

last is called recursion, and sounds

fallen over, squeak like a covpu" and it might take longer than a second to complete. So you're deep inside your "do 10 things" routine when another second comes up and the routine is called again. If the thing's not recursive, all the information needed to complete the first call will be overwritten by the second call, and when the covpu

routine finishes the chances are the computer will crash.

But if everything's safe on the stack. all will unwind safely. The only proviso is that there's enough room between the stack and whatever's next in memory...

Finally, always comment your subroutines with special clarity. It's a good idea to put at the beginning of each subroutine a comment noting the registers it changes and those it saves the amount of stack it needs. what the routine does and any other special things it needs.

This makes it easier to reuse the subroutine later, as well as making your programs even easier to read. It's a hassle, but not as much as the onset of FWABF at three in the morning

This month's program uses subroutines to display different animal names

By shuffling the order of the various subroutine calls, the order of the names change, too - much easier than moving large blocks of data around. Although it's not particularly fruitful (whoops, sorry EC).

# **Making movies**

Sam Littlewood gets things going in the penultimate part of his animation series

OMPUTER animation is as fashionable as Ozzie soaps, although it has been around almost as long as jeans which button up. Nothing gets an advertising agency reaching for the chequebook faster than the thought of the client's name flying down the Grand Canyon in six foot silver letter.

Animation falls into two bread styles. The first is to describe the motion of fixed objects over time. The description is often in terms of a path. This describes position, pitch, roll and yaw, and scale. A refinement of this system is to allow paths to be attached to other paths—giving while a head is turning. Some statement of the system while a head is turning. Some systems allow the special objects in an animation to fly along paths, such as the lights and camera.

The second category is to describe the world at two separate points in time, and the computer then works out the intermediate positions. An object can be changed smoothly from a cube to a sphere. It could explode by defining the normal object at the start of the sequence and the totally exploded object at the end. The intermediate stages of the explosion would be automatically worked out. This technique is know as tweening.

Of the existing tools, SculptAnimate-3D provides the most control
over animation. Both path-based
animation and tweening are available.

fully hireachical. This allows you to
build up a big path from lots of little
ones. The tweening capabilities can
be applied to every aspect of an
animation, including colours,
animation, including colours,
camera and so up., noon of the
camera and so up.

HERE are two versions of VideoScape-3D. Version 1 has limited path based animation, and objects can be tweened or morphed as Videoscape calls it. A morphing object could be flying along a path at the same time. Version 1 does not allow hierarchical paths. Creating complicated motions, a hatch opening on a moving spacecraft for example.

may require a program written to generate the motions. Version 2 allows paths to be attached to other paths, making life far easier.

paths, making life far easier.

Other packages have similar facilities – Turbo Silver has hierachical path-based animation.

Forms in Flight has simple path-based

animation, like Videoscape Version 1.
The movie being discussed in these
articles has a relatively simple set of
animations. The objects do not
change shape, they only move. The
main motion is the movement of the

- camera. The various motions are:

   Camera starts at back of auditorium and moves down to focus on speaker standing at podium. It then moves behind the curtain at the rear of the
- stage and moves in on the bull.

  The speaker is talking the head is nodding and turning. The body is rocking backwards and forward. The arm is waving.
- The bull's head is nodding in some semblance of chewing.

Of these motions, those of the speaker are the most complicated, and will be a hierarchy. Starting at the top of the hierarchy, the torso is moving backwards and forwards, bending at the hips. The torso is one object, while the legar are stationary. The torso is given an oscillating path within Sculio-3D.

The first step is to make a circle.
This is then scaled in the east to west direction so that there is no side-to-side motion. This path is then scaled so that its length is about half the depth of the torso. The path is not attached to anything else, it is at the

The bull's head needs a small path to create a nodding effect

top level of the world hierarchy. The torso is attached to this path as a child. The path is in the centre of the

The torso will now oscillate backwards and forwards. There is one slight problem, the top of the legs and the bottom of the torso are not connected, giving the impression of a bad magic trick. The path is modified so that the torso tilts while it moves along the path, keeping the bottom of the torso at the same position as the top of the legs.

We now have a torso waving back and forwards. When creating paths, it is often worth working on them at a large scale, and then scaling to be very small in one or more directions. The torso's path is a loop, in this case of 20 steps. The path will be repeated as necessary.

Remaining paths in this hierarchy are constructed along the same lines as the basic one for the torso. Two paths are added as children of the torso's path, one for the arm waving, and one for the head turning side to

side.

The arm is similar to the torso. A path is attached half way up the arm that is a circle squashed in one direction. The pitch and roll is

Most of the bull is hidden

modified so that the arm stays connected to the shoulder. The head has a further path before it is attached, a small nodding path. The hierarchy is as follows:

Torso\_wave -+- Torso ---- Left\_arm +- Arm\_wave - Right\_arm +- Head\_wag - Head\_nod --- Head

The left arm was originally going to be given a path that kept the left hand in contact with the podium. This was later changed to keep the arm at the side of the torso, since the camera would not be able to see much of it anyway.

By keeping the right arm still the number of paths can be reduced

The link between the bull and the man still needs to be established

AVING created a complicated none of which caused anything to actually go anywhere, the next path is actually go anywhere, the next path is that of the camera. Within Sculpt-3D, the camera can be attached to a path and be given roll and tumble just like any other object. This path was created using a spline.

The length of this path in points will be the length of the final animation in frames. The current estimate for the number of frames is 128. The two endpoints were made, and a straight line put between them. This was then subdivided seven

times.

Having created 128 points, a few were picked as key points and dragged to important places, selected, and the whole thing made into a spline, the remaining points sprung into the intervening locations.

After defining the path of the camera, the pitch and roll must be modified so that the camera keeps pointing at the areas of interest. This is done by hand and with judicious use of wireframe previewing.

During the first part of the path the point of interest is the speaker. Having moved up to the speaker, the camera slides sideways through the curtain and the point of interest is now the bull back stage.

The speed of the camera movement is controlled by the distance between points. In this case the points are bunched up at the point where the camera moves up to the speaker. The camera slows down as it moves up to the speaker and then accelerates

The final path to be added is that of of the bull's head nodding. The same techniques that were applied to the

speaker are used here.

This animation has made extensive use of paths, including hierarchy to get paths attached to paths. Creating the paths requires a large amount of previewing, the wire frame proview modes of both Sculpt-3D and Videoscape-3D being both ideal for

To create smooth motion, both of the camera and objects, the paths are constructed from smooth objects such as splines and circles.

A common situation is to have an odding or spinning. In these cases it is a good tactic to make a path and then shrink it so small that the object does not go anywhere. An example is to get things to spin — make a circular path and then shrink it to a point size. With the objects hooked tocether.

the next stage is to generate the individual frames. The wire frame previewing during the animation stage should have sorted out any problems of the camera pointing in the wrong direction, or objects not coming into view.

The generation of the final images is the subject of the next and last article in this series.

The Bomber team surround Vektor Grafix founder Andy Craven (back wall, black sweater) while co-director John Lewis (far right, on the table) guards

Everything is different about each plane, even the handling, and you will be able to fight one of 14 potential computer controlled adversaries.

Vektor founder member and director Andy Crane came up with the Bomber idea while conducting research for a game that never happened.

He discovered that every year the USAF Strategic Air Command plays host to the Curtis E. Le May International Bombing Competition (God Bless America and all that).

Andy realised this was a

natural for the home computer and, together with his 11-strong programming team, has turned it into a game where you can arm your jet to the teeth and blast away at anything that moves.

Vektor co-director John Lewis admitted to Amiga Computing that as a flight simulator the game may lack octrain features: "We've tried to keep as close to the actual aircraft as possible", he said, "but realism has had to run a close second to fun". The package will cost £25

to £30 on two discs - maybe three - with lots of background info on all the

of the same name.

Arming the F-15 Strike Eagle in Bomber, the working name for Activision's summer release flight simulator

planes, plus there is a Dir scenario option built in to the the game, opening up the possibility of extra "mission" discs. With Bomber almost fin-

ished, the Vektor team has begun work on its second major project. What is it? John Lewis won't tell, but Amiga Computing can reveal that it is not a flight simlulator.

Instead it will use Vektor's natural language parser - "It can do things that Infocom's falls down on", says John. But it's not an adventure. Sounds intriguing. Watch this space...

## Down to earth challenge

ROM the creators of the absorbing Joan of Arc (Amiga Computing March, '89) comes the visually and aurally stimulating Journey to the Centre of the Earth. The game has you playing

The game has you playing the role of an eminent scientist who has to negotiate echoing caverns and winding passages in an attempt to follow Arne Sakmussen's steps in the Jules Verne novel Stampeding mammoths, cascading rocks and slimy reptiles are just three of the hazards you will have to face. Beat them off, find the correct path and your reward

is a stunning 32 colour picture of your next destination. Review next month, when we'll find out whether the gameplay lives up to the graphics. Not the

Not the centre of the earth, but a resting place on the journey?

## All the latest news on the games software scene

### First impressions are favourable

EMEMBER Oids and Thrust? Well the format lives on with Raider. the first release from new software house Impressions.

To save the inexorable star system you fly through a set of four planets, killing every turret on each before a small green cog appears. Tractor up the cog and fly to the next

Once you have all four cogs you can enter the powerplant where you have a limited time period to position them and escape before all something-or-other blows

We've only seen a onelevel demo so far, but can tell you that if you're a Thrust

Thanatic or an Oids Obsessive, pretty soon you're gonna be a Regular Raider. The gravity feels good. Full

review next month. Provided the programmers get their collective finger out, of course

EVER been stuck in the house on a wet Bank Holiday Monday, all the shops closed and you're bored of everything that fits into that inviting slot on your dear Amy?

OK, so maybe you haven't played Death Mutants from the Planet Nong all that much, mainly because it isn't all that good. A real "push it to the back of the drawer and hope it goes away" case. But it won't. Neither will the 25 quid hole it made in your bank balonce.

Well, said he in his best washing powder advert voice, the Holiday Monday Blues are at an end. All you need is Cosmic Pirate and your horodom troubles vanish.

boredom troubles vanish.

So maybe it doesn't have 3D graphics that lark seductively with the whispered promise of "Wanna good time?" It's got sprites, though, and plenty of them. It was also written by folk who clearly know an

Amiga from a Vic.

The instant the disc goes in pretty things start to happen; every home should have the beautifully done

animated boot sequence.

Oh, you want to know about the game? All right then, if you insight then, if you insight then, if you have you play the part of a rookie Cosmic. Pirate who has joined up with Nest 51 tam for safety. Nest 51 happens to be a ginomous space stome with all the facilities that a cosmic pirate's warped mind could wish. The only swines are the taxes, which run in the 901 to 99 per variety. World still make a wodge of dosh, because prizery is faintly of dosh, because prizery is faintly as

itable. Nest 51, although totally despotic in nature, looks after its own by running simulators and supplying shins.

The free simulators are there purely to get your shot accuracy percentage above 30; Nest 51 won't let anyone go out without that as a

Everything gets thrown at you very quickly in a simulator. Time to buy a Konix Navigator Autofire stick, methinks.

The first ship you get is a useful. basic device. Everything works, but don't try anything flash. Once you've booked a mission from one of the 26 grades you are free to zoom off, but not until you've paid Nest 51 even more cash. You'll have an overdraft, and if it gets big some nice people will come and shoot at you.

Once out of the Nest, and after some very pointless but beautiful effects, you arrive in a sector. Things appear that have it in mind to show you that they don't want to be friends with you.

If the feeling's mutual, they'll soon

blow up, sometimes leaving little capsules - you'll have seen it in Zynapslapfight III v1.3 (The Revenge) - but they don't just go away if you fail to pick them up, they turn into little guided missiles. These

do you a lot of harm. Laffs, huh?
You may notice a little T symbol
which moves about cunningly. This

usually costs. If you've harmed enough aliens, you can get through extra points are saved against the next journey.

Once in the portal, you can move closer to the fish-like ship or towards a planet. Planet strafing is fun, and can be very profitable. But one can come over all dead. Once you find the ship you shoot it

Unit if gives in. This would be great, but until it gives in. This would be great, but unfortunately it's doing the same to you. Once pacified you guide it back along the spacelanes, shooting all the way. Nest 51 takes the ship, gives you some money - not much - and you are free to continue living.

And so it goes on. It's like Elite minus the 3D bits and the docking, but plus gonzo graphics and fabbo sounds. It makes the most staid, sensible type want to do something very unstaid indeed.

Cosmic Pirate is fun to be with. I've played it for hours and will play it for many, many more. I want to have its baties. Buy Cosmic Pirate and kick some donkey!

A small play area is unexcitin

AMES with two-player options aren't new. Captain Fizz is different in that instead of the players competing against one another, cooperation is needed to solve all the puzzles.

The plot is a bit overworked: A starship is out of control and heading towards the sun and only you can save it by deactivating the main computer.

Both players start at the bottom floor in the ship and must get to the top floor using the emergency lift. Before the lift can be activated all the ordinary, non-functioning lifts must be de-commissioned. Access on the decks is restricted by

doorways, which can only be opened if the player is in possession of the correct colour-coded card. Force fields are also in operation and they need a little more thought to overcome. The decks are swarming with the obligatory allens, moping about and generally getting in the way. Money can be picked up and exchanged at vantage points for extra

health. Various other items can be collected to increase your armour, damage rating and charge rating. These factors determine how well

you can communicate with the enemy and how resistant to damage

you are. On the higher decks - the ones with mines going off all over the place, not to mention a kill-crazed missile launcher - a high armour factor can be a life saver.

Another interesting feature is that death is not a permanent condition. If your compatriot is still alive and can make it to the next dock, a replacement clone-brother will be teleported aboard. If the unfortunate should occur and both players are stuck in a logical impasse, one can make the ultimate sacrifice - the suicide ultimate sacrifice - the suicide

When both players die the game can be reset to the last nearest level, in multiples of five, which saves having to start again from scratch, the prospect of which could send you as criminally insane as the guys who wrote the title music.

The game screen is split into two halves, each showing a plan view of part of the current deck. Scores and the status of each player are shown in a large box on the left. This has the effect of making the actual playing zone each player sees about a quarter of the size of the screen. As a result the graphics are very small and undetailed.

When a player moves out of sight the entire play area flicks to the new zone. With both players running about, the constantly changing screens can be very confusing.

Players can appear in both halves simultaneously – the shock of suddenly coming face to face with your colleague can cause the trigger finger to slip, which doesn't help when the health levels are getting low.

First impressions were that of diaappointment because the graphics are small and the sound is minimal. The puzzles, which demand thought and cooperation, are seemity impossible on your own. Unfortunately the baser human instincts are always drawn out and the game can rapidly degenerate into petty retaliatory tactions.

John Kennedy and Green

# MOTOR MASSACRE

Worse than the M25 on a wet Monday

THE holocaust has come, laying waste to wast tracts of once beautiful countryside. Out of the devastation emerges a breed of survivors, barbaric in their thirst for power and dominance. To survive even a day is hell.

You must compete in the most horrifying carnival of motor destruction ever conceived. No, it's not the Stoke Poges by-pass on a wet Monday morning but Motor Massacre from Gremlin, the latest addition to the "car is an extension of a man's joystick" school of games.

Cause of the problem is the evil Dr. A. Noid, creator of the vile and mind-hending food substitute Slu. Now everyone is trapped in the cities, unable to break free from the grid Slu addiction. Killer cars cruise the streets, strung-out zombie mutants roam abandoned buildings searching for a healthy victim to contaminate—you know the sort of thing.

Your mission is to seek and destroy the mad doctor, and you're going to have to fight your way through three cities to find him.

cities to find him.
You must locate the supplies that
will help you survive. Money doesn't
mean a thing, food does – but first

you've got to find it. You cruise at the controls of your Armoured Tactical Vehicle (ATV) through city streets filled with hazards such as oil slicks, gun turrets, land mines and enemy cars intent on ramming you, searching for the entrance to one of the derelict huildings.

the derelict buildings.

Inside you find the food you need to trade for fuel, weapons, ammo and repairs to your battered ATV. But take care, the buildings are full of slimy mutants. They're slow and easy to blast but there are a lot of them and

if one touches you your health level drops. If it drops too far... Before you can leave the city you must find a pass to the areas. There you must take part in a demolition derby. Your ATV converts into a Ram-Car. This is smaller and more

manocuvrable than your opponents.
No guns are allowed in this contest
- the only way to destroy your enemy
is to ram him often enough and
smash him to bits. Land mines,
flipping floor tiles and the bottomless
ut that surrounds the areas all add to

Once you reach the second city it all becomes much tougher. You have to shoot the cars more than once to

destroy them, the mutants are harder to kill and the battle in the arena needs all your skill. It gets worse for your final battle with the mad doctor when you reach the third city. Computer games are becoming

ever more complex. This can result in a game that is thought-provoking, needing both strategy and subtlety for success. Motor Massacre is about as subtle as a brick in the ear. There is nothing new about the gameplay nor about the obstacles to be overcome, there are just a lot more of them than you'll find in most other cames of this type.

A save facility is available so that a lot of hard work need not be lost in

### **CHASE**

Into battle with a mouse

WE will dispense with the blurb on this one because quite honestly you've heard it all before the usual stuff about a captured princess and a gallant pilot setting off to face the enemy hordes. Basically you have to dodge things and shoot down the foe.

the foe.

There are several stages. Firstly the initial pursuit phase in which you

must pilot your craft through a wire frame meteor field and shoot down the enemy. If you survive this you must take on a sort of giant slalom run, weaving in between giant monoliths. Not quite sure why you have to do this.

After that it's off to the Quadrilateral Vortex, otherwise known as flying through squares. This is quite difficult because there are obstacles in the tunnel which you don't see before it's too late. Then you must zap a few more baddies. Where Chase really falls down is

where class reamy sais s own that you can only play it with the mouse. Before you buy a mouse-only game there are a few questions you should ask yourself, like "Have I got a really large desk?" and "Would I really like to pilot an expensive spacecraft with a mouse?"

The vector graphics are done quite well, except in the vortex tunnel, where it is difficult to determine whether that thing up ahead is a

yellow square or a red square with a yellow square displayed on top of it. A mistake is usually fatal.

Also more thought could have been taken with the choice of colours. The instructions describe the enemy ships as being "a sort of putrid blue colour". It is difficult to argue with them on that point.

This is a budget game. Prices are quite high on standard Amiga software, but at least with games like Falcon you can feel certain that a large proportion of the cost actually went into development and not into high interest bank accounts.

SCREEN SHOT FROM

# **POPULOUS**

Do you feel omnipotent?

FEELING a little run down, are we? Things not quite going the way they should? What you need is a dose of omnipotence - create your own planet, colonise it, nurture it, that sort of thing.

And if another pseudo-supreme being should happen by, you can destroy him, plus all his misguided

The idea behind Populous is to be the best. Top God, as it were. You start off with three followers, known as Walkers, a leader, some land and a religious centre. the Papal Magnet. The more the Walkers worship you, the more power you have. The more power you have, the more you can do for your people, thus generating more worship.

You can also do the dirty on the followers of the opposition, either Evil or Good, dependant on your alignment. Doing the dirty can be the relatively harmless nicking bits of landscape, to the positively ullimate vary large following in the Final Battle, Armageddon. If you don't have a very large following in the Final Battle, Armageddon outs here. Ah, the joys of cheap and unavoidably obvious runs.

Your people can build on flat land the larger the area, the more secure the settlement and the stronger the followers produced.

Your Walkers can settle and multiply, gather to form a powerful Walker, make their way to the Papal Magnet or fight any infidels about the A dely's have is list cade

They're more likely to do these things if they have plenty of good ground and as much protection from the other side as possible. They will usually ignore enemies unless they are attacked or you have instructed

them to fight.

Leaders can be transformed into knights who carve huge inroads into the enemy with a joyous gesture after every victory. Knights are the quickest way to gain dominance, although creating one takes a fair silice of manuel.

Once your people have boosted your manna supply to an adequate level, you can start damaging the opposition. How about earthquaking them? Building swamps whiles away the millennia, especially when the opposition are apt to fall in them. Volcanoes are fun; damage is repaired by razing the area to sea

level and then rebuilding it. Total enjoyment, were it not for the fact that the opposition is doing the same to you.

Once one world has been won to your cause the next one in your campaign will be more difficult, with harsher terrain and a more intelligent enemy. Apart from the enormous

flexibility of the game options - you can even make your opposite number very stupid - the really smart feature of Populous is its comms feature.

Usually the game is single player, but with the addition of a modern two can compete. More sociable types can use a null-modem RS212 lead and talk to someone at a closer range. High baud rates increase the speed of movement, and all versions of Populous use the same protocol, so Amigas can talk to STs. I can forese many budding delities having trush answering to a very large phone bill—a short game takes an hour.

The graphics are neatly isometric and the sound is suitably big for a game about supreme beings. What could really be done without is the flashing of the power LED on the Amiga casing in time to your heartbeat. Nervous types may

assume a crass.

If the world's getting too much for you, build your own with Populous. It'll take you more than six days, and you won't want to rest until you're

Stewart C. Russell

# **CHARON 5**

Plot's tiredness shows

Boring landscape lacks detail

AFTER an odd start the scenario for this game is fairly standard stuff. Board the mysterious intruder, which is called - surprise, surprise - Charon 5, get captured by aliens, become trapped in a tight corner, blast your way out.

There are some almost superfluous trimmings such as repair of damaged airlocks and control circuitry, but they are really a euphemism for yet another scrolling shoot-em-up.

According to my juvenile psychologist 1 am supposed to be a superior thinker with quick refleves. Clearly 1 am neither, judging by my progress so far. The circular ship, known as a HUMAN – Highly Usable Manoeuvrable ANdroid – is viewed from above. It moves across a rather borting landscape, almost completely devoid of death.

Most of the time HUMAN is wedged tightly in a narrow channel. Only occasionally do these channels open out into rooms, where the nasties lurk. They generally look like small balls of cotton wool and are fast, evasive and can take several direct hits before they are destroyed. The consequence is that it is only

too easy to get blown up within a few seconds of starting off.

Pressing Fire while hovering over certain objects on the ground will transfer you to one of the computer

screens. Here you can mess around with the components needed to fix the airlocks and other broken bits.

unfortunately the methods of control needed to do this are very complicated and frustrating. You need balletic grace with the joystick. The most serious condemnation of

Charon 5 is that it doesn't look like an Amiga program. It could easily be mistaken for a competent CPC or O64 offering.

The plot is tired, the means of progressing beyond the first screen obscure, the graphics uninteresting and the colours dull. There is some enormous, smooth-scrolling text on the startup screen, plus an excellent rotating logo on the loading screen, but the unfortunate tendency to use 80 column text makes for poor viewing with a television.

Alastair Scott

A. H. the great British holiday. Two weeks of well remembered pleasures and traditional delights at Studgethorpe-on-the-Mire. From the moment you're evicted from Studge Studies who desided his Muddoon, the tathous on her muscular forearms glinting in the cold light of dawn, until the hour when fostore and weary you tradige back to face a welcoming plate of Salmonella Salad, your day is played our monella Salad, your day is played on.

according to a time honoured ritual.

Long hours spent sheltering from
gale force winds and driving rain,
huddled for warmth around a cup of
lukewarm Bovril; hone shaking rides
on an evil tempered donkey around
the Studgethorpe Municipal Car
Park; and ahove all else the activity
without which no holiday would be
complete, the countless rounds of

crazy golf. No other British institution is capable of dividing families with such ruthless efficiency.

Dad, with his 15 handicap and a putting stroke as demonstrated by Sandy Faldo in Golf Monthly, spends 40 minutes trying to force his ball up a pig's bottom while six-year-old Johnny, with a style that Sean Kerly would be proud of, whips round the course twice in two under par. Memories are made of this.

Now you can recapture the thrills and excitement in the comfort of your own home. Zany Golf is as entertaining, offbeat and totally frustrating as the real thing – and more. From the opening screen with its superb graphics and music it is apparent that this game is a bit special.

The basic mechanics are simple. A round of Zany Golf consists of nine

holes and can be played by one to four players. The mouse is your putter and is used to spot the cursor on top of the ball

Holding down the left mouse

button reveals an X under the cursor. Moving the mouse in any direction with the button held down produces a dotted white line that indicates the distance and angle of the putt.

The further you pull the mouse back, the harder your putt. Release the mouse button to play the shot.

Each hole must be completed within a specified number of shots, otherwise you're out for the rest of the round. The first hole is a par two. although you are allowed up to five putts. Any unused putts are added to the par for the following hole to determine your stroke allowance there, and so on.

From time to time bonus shots are available either for completing a hole within a time limit or for hitting a fairy with your ball. A score card can be viewed to keep track of your pro-

The holes themselves are colourful, superbly detailed and have been designed with a good deal of imagination and wit. Windmill, the

Electron

Overall - 95%

first hole, is the one that is closest in design to those found in real life. You putt up a slope and past the mill's revolving blades in order to send your ball on to the lower half of the hole. From here on in it gets progressively more surreal.

On the second hole, Burger Bar, you have to putt round a U-shaped track by bouncing your ball off a large bottle of ketchup into a hole protected by a giant, bouncing

quarter-pounder. Ant Hill finds you trying to knock your ball into a hole that is situated on the plateau of a pyramid shaped hill. Just to make it more difficult, the

hole is moving Energy, the final hole, is a lulu, a sombre, mechanistic landscape, crisscrossed by energy beams waiting to

blast your ball into oblivion. Merely completing a round needs a lot of skill and a liberal helping of luck - to do so under par is another

matter. One slight nigglette is that it takes an age to load each hole, probably inevitable given the level of complexity involved. The game can be loaded from a

hard disc, so those of you lucky enough to own one - both of you shouldn't experience this problem. Zany Golf is not a game that you

would want to play continuously for a week. Neither is the real thing, they are both best enjoyed in short bursts at frequent intervals. There can be few better games available at the

# HOSTAGES

Your chance to join the SAS

ONG ago some bright misguided I spark hit on the idea of demanding things with menaces. Clearly this must have gone through some evolutionary problems, because demanding a ransom for a mother-inlaw sometimes ended up satisfying for one party and annoying for

After a while the captors got so sick of being grilled on whether they had a clean handkerchief that they gave

Hostages is not so trivial. Here we have a meticulous reinaction of a siege situation. Designed with the aid of the French National Gendarmerie. it has three basic stages - deployment, entrance and neutralisation. That last one sounds pretty ominous.

Terrorists of unknown persuasion have taken hostages in an embassy. You, as the team leader, must arrange the deployment of six specialists three marksmen and three Direct Intervention Combat (DIC) soldiers. Your team of three marksmen must

take up places which will provide covering fire for the DIC men. These positions are given on a map, which also shows where the men are currently stationed

Positioning the men entails running along the street past the embassy, dodging into doorways to avoid the terrorists' searchlights. A digitised "Aargh!" followed by your man falling over is a sure sign that you need some more practice.

If one or more of the team gets shot by the terrorists the game goes on, but with a greater risk of failure since the DIC men need all the backup they can eet

Once dropped off by helicopter, the commandos abseil down the building to gain entry through a window. The marksmen can provide cover at this point - a terrorist could be lurking in the same room. More digitised "Aargh!"s either mean that there was indeed a terrorist in the room, or that you have run out of rone while abseiling.

Once inside - more digitised bangs and crashes - the hostages must be taken to the safe room in the embassy, and any extant terrorists must be remedied with your Walther PPK. Being devious types, the terrorists often hide behind hostages, making your job a little more inter-

The embassy has three storeys, each with the possibility of hostages and terrorists. Movement is like an

updated 3D maze game, with the corridors moving in byte-sized chunks rather than a smooth scroll. The action sequences proceed in a series of freeze-frames, heightening the suspense - some encounters are

truly heart-stopping. Any hostages found immediately latch on to you. They will follow wherever you go, so it is important to clear out the third storey quickly that's where the safe room is.

Any number of DIC men can be in the building at once, all at different nlaces. The action can be switched quickly between them, allowing them to eliminate the terrorists on all levels. Once you have either run out of DIC men or terrorists, the game | finishes with either a derogatory or complimentary newspaper report.

Hostages creates an air of tension unlike any other action game I've seen. The graphics, although competent, are fairly drab and show a definite ST ancestry. The sound is very well executed: small incidental tunes being variations on a theme, all popping up at the right moments to add

to or defuse the situation. The only real problem is the length of time spent staring at a blank screen waiting for another section to load in. Surely it would not have been too difficult to give some kind of display?

however, along with the suspense, will keep Hostages a much-played

PREPARE to eat hot gamma rays, Alpha Centaurian! When you read a sentence like that you know you're either about to read an excerpt from Niven and Pournelle's Footfall, or it's the start of another shoot-emup review.

up review.

In this case it's a review, but before you start complaining, it isn't an

before, read it before review. No siroe, because this is a review of the best sideways scrolling shoot-em-up ever released for any home comnuter.

Now you all know that those spoilsports at Activision made US Gold keep Katakis off the market until after Christmas because it was so similar to R-Type. Well a few changes were ordered to while away the programmers' time, including the name, and now it's back, better and badder than before. It's a total blasting

experience.

It all begins quietly enough with a parallax scrolling starfield filling virtually all of the screen save a small

control panel at the bottom.

In troops an attack wave of laser fodder. Waste 'em. An icon pops up. Run it over and a nose appears from the stores, floating behind you. Go

the stores, floating behind you. Go back and collect it. The nose is the essential accessory for trendy blasters, the difference between life and death.

Suddenly metallic-blue scenery scrolls in, missiles come hurtling towards you, stompers stomp across the bottom and floating aliens fire repeatedly. Before you can draw breath the next icon makes an appearance. The phoney war is over, the serious action starts here.

All this lot was actually level two

of Katakis, but it has been modified and made easier to form the introduction to Denarish.

On you fly, encountering spiralling attack waves, laser gates dropping from the ceiling, large blocks which pile up blocking the way, hopping aliens, running aliens, aliens on jetbikes, aliens seiling ice creams – only kidding – and not forgetting those lovely icons.

lovely icons.

After dispensing with one huge mother of an alien at the end of the level, it's shock horror time on level two as throbbing spheres and wicked looking boomerang-style attacks are just a foretaste of what is to come.

# PRICON

#### Aliens have studied martial arts

tricky passages is the order of the day. More jetbikers on a road to nowhere are just waiting to die for the cause of entertainment. Then again, I do hear the pay is good.

Tumbling panels - which were first seen in Xevious - and a swirling field of spacemines are two more of the hazards to be overcome before you get to the really difficult stuff on level three

This is a grev metallic hell with little room to manoeuvre and less time to react. Indeed the challenge at the end, which is a total R-Type steal involving a mechanical snake-like device, is impossible unless you have protective pods to keep out the point blank firing Around this time you might have

collected what I take to be the final weapon to add to your arsenal homing missiles. My, are they fun!

If you are looking for a game that needs fast reactions, that delivers a satisfying killing experience, that is the ultimate in sideways scrolling destruction, then look no further. Get a copy of Denaris, get that nose, and give those Alpha Centaurians some

hot gamma rays

HE scene is set with some ominous vet funky music. A large domed city is in the distance. As the sun rises over it vou can make out some rather large cracks. Clearly this is a city requiring serious repair

What is worse is that you are stuck inside it with nothing but a pair of jeans, a T shirt and your wits to help

distinguish from the backgrounds, so the little red light which flashes on the status screen is appreciated. If nothing is immediately obvious,

selecting the Search option will cause your figure to spin on the spot and have a good nose around. This can get a bit tedious at times, especially when someone has thoughtfully placed some boobstraps.

form of some nasty aliens who seem to have studied too many Bruce Lee martial arts films. You can punch and kick them, but if they get too close they'll take you in a stranglehold from which only a frantic waggling of the joystick will save you.

The sampled sound of some poor soul choking is thoughtfully played to remind you that you are dving.

**Duncan Evans** 

you. You are in Prison whereabouts.

The display is halved between your various scores, lives, objects held, status windows and so on, and a graphical representation of your

Your persona in the game is a well programmed male figure. He walks and jumps left and right using about 16 frames of animation, and very smooth it looks too The backgrounds are well drawn,

colourful and detailed. Although the desolation can get very depressing, the occasional touch of humour cheers things up.

The only way to escape from Prison is to solve a series of puzzles using the various objects you will find. These are sometimes hard to

The same mad homber has placed mines in the footpaths, so not only do you have to watch out for objects and aliens, but you have to watch where you put your feet

The puzzles start at the Sun reader level but progress quickly enough to make things interesting. The first problem is how to get the lift doors open so you can move to the next level. Sure enough, not a million miles away you find a plastic access

card and a piece of wire But now a dilemma: Do you try using the card, or do you bypass the lift door with the wire? The wrong decision means the end of the game. This is where the Save Game option is invaluable

The arcade action comes in the

Prison is a good blend of puzzles and occasional Kung-Fu fighting. Although not startlingly original, it is well done and fun to play

# ILKBUKNER

HEOLIEBOOKS at 5 o'clock. With a flash of a Parker on the dotted line, the biggest arcade licence of '88 was won for Activision. The rights to convert Sega's Afterburner for home computers went for between £100,000 and £250,000, depending on who you believe. It was down to Argonaut Software

to create a game which justified Activision's handout to Sega. The F.14 Tomcat is an awesome fighter. capable of taking on six enemy planes at once. Afterburner really tests your flying skills by presenting enemy craft.

This is no simulator, it's a seat of the pants blast-'em-up. As the skies fill with targets you can take them out with either your constantly firing machine gun or move a crosshair over the foe and target a Sparrowhawk. This triggers the lock-on logo. while a box on the head-up display shows which target is lined up for the missile treatment. Your main problem is spotting the incoming missiles among those you 1 have sent on a mission of death. I guess real F-14 pilots have much the same problem. I found a good technique was to alternate between minimum and maximum thrust.

It all gets a little repetitive, although a phase of flying down a canyon is quite fun.

There are interludes to rearm and refuel at the end of each level, all of which have been copied across from

the arcade game. A flying tanker can top you up with the best unleaded the USAF can provide, while later on you land among a collection of bowsers and a ground crew.

It is in these interludes that the arcade programmers have included some nice touches. Sprites from other games appear, such as the Super Hang On motorbike and the Out Run Testarossa. They have suffered a little in the translation - I'm told the

£24.93 Overall - 45%

colours had to be restricted to get a multimegabyte game on to two discs. Afterburner was a feast of fast

action in the arcade, complemented by great hydraulics. At home the game fails to live up to that, but then there is no way an £500 home machine, even an Amiga, can compete with £9,000 worth of dedicated hardware

The Amica version is by far the best, a good deal faster and slicker than the ST game, but still fails to live up to the promise of the screen shots on the box. Activision may be the winner in the battle of the licences, but it is the gamesplayer who loses the war.

# **SOFTVILLE Public Domain** BRATAINS

### **UGA** Collection

You have seen all the other 'collections' of disks but never anything like these. All are 'auto-boot', all are menu driven and very easy to use. Available ONLY from Softville, a collection you must get

ONLY from Softville, a collection you make your MUSIC. A S 6 5 - These disks are full of great musc, all have at least for busse to play through your monitority and an analysis of the property of the second SONIX

USON1,2,3 & 4 - These disks are full of SONIX tunes, also will an accompanying screen for each. You don't need a copy or sonix, they play straight from the menu through your Tvilldonton.

INTRO's-DEMO'S

UINT1 - COORTypnote circles by Thoust. Lateron by Arcadia, Patrij by ITI. Balls by M.F.C. COC by CSC. Spacedemo by Med Morks, Europe by ArC and others, a great coffection.

UNIT - Wingdamo by Altafez, Supenhori by Sumiders, Second Na Book (1998) - William (1998) -

UUTIL 2 - VrusX, Weathergraph, Popol3, Animbals, Juliaset, Diskx 2.2a, Startup, Xboot, Cloon, Ionstal2, Memview, Grab, Yrushunter, Clockdoctor atc. etc. As above, choose them from the menu and press a key to run.

We now have over 50 of these great disks in our collection, the full range includes slideshows, animations, utilities, "special disks" etc etc. Send forour FREE catalogue and prepare to be AMAZED.

STARTER PACK any FIVE pd disks, FIVE blank disks and a library case to hold them all - £19.50

We have over 800 DISKS

We have over SUU DISKS in our catalogue, including the entire FRED FISH, (currently up to 194) PANORAMA, APDC, SLIPPED DISK AND FAUG Collections.

To get a copy of our 40 page FREE catalogue, send an A5 spe S.A.E to the address below (22p stamp). Make sure you quote this magazine and state AMIGA clearly. We also have a vacilities of disks for Atlaff and all MAMCA, sak for a catalogue if required.

## SOF Collection

the very best programs available and covers the complete range of public domain/shareware, so good others sell them as is, get the latest here!

SOF10 - A disk full of MIDI utilities including - MDIuti, MDI2, Panil 2, CZ101, CZL (patches for CZ101) and MDIBox, plans for building your own MIDI interface etc. etc.

SOF13 - MANDLEBROT explorer, fantastic shareware graphos designer, includes Zoom, screen resolution, colours, IFF screen save, 3D views etc etc. Fantastic implementation.

SOF15 - CLIP ART, in high and low resolution, for use with any IFF compatible paint program, out out any of the dozens of graphics for use in your own artwork. SOF21 - PAGESETTER CLIP ART, dozens of cip art files for use with the Pagesetter DTP program.

SOF27 - COMMS dsk. A phenomenal shareware program that features. Xmodem, WXmodem, auto-redial, 300-8500 baud, macro keys, phone directory, printer control, split windows, auto-chop etc. etc. plus loads of useful diffuse.

S O F 6 8 - Classic BOARD & CARD GAMES including Que, Othello Klondke, Carrield and Orbbage

S OF 69 - Classic ARCADE & BOARD GAMES including Backgam-mon, Yachtzee, TVision, Missie Command, Cosmo2 and Breakout

SOF124 - PLAYBOY SLIDESHOW. Auto-run sideshow of pictures from this famous magazine! SOF191 - A-RENDER V3, includes an execute demo to see some great ray-traced pictures, print manual and full documenta-tion. This needs switched 1,2 and runs (sub) from the city of this property of the pro

# **Happy** hacking

It's worth the risk Hacking a disc So all you folks Can have the best pokes. MTH will demonstrate With cheats to captivate

HEATING may have become a little unfashionable since Michael Douglas had boiled rabbit for dinner, but that hasn't stopped John Heywood from Anglesey, Gwynedd, putting together a whole bunch of cheats for Uninvited.

He advises you to open the bottle of No Ghost and operate it on the female ghost that appears in the hall. Operate the can of Spider Cider on the veranda. Operate the lamp in the bedroom next to the kitchen. Put the spider on the ghost when it appears.

Operate a knife on the left chair in the entrance hall to find a key, which will unlock the cupboard in the master bedroom and the cupboard in the recreation room. Say: "Instantu illuminaris Abraxas" to the dogs outside the chapel. Say: "Specan heafod abraxas" to the fortune teller doll, the statue in the entrance hall and the head of the statue in the chanel.

A door will open after you speak to the head of the statue in the chapel. Make sure you have the lit candleholder from the chapel. To light it, operate match on matchbox then operate match on candles. Move the cross in the chapel. Operate the golden amulet from the envelope on it to kill an individual zombie John also has tips for the Faery Tale

adventure. In the Citadel of Doom fall asleep against the blue wall. To do this make sure you are very tired, that you are right up to the wall and that you are carrying a bow and some arrows with which to kill the

necromancer.

The lava is awkward to get across Use the vials to get your vit up. Then save the game by the lava and keep trying to cross it. Another way to get your vit up is

by killing a lot of enemies to get a higher bravery scorer (brv). When you are next killed you will get more vit if you have more bry. Instead of

#### By Max Tennant

killing those nasty creatures, you can increase your bry by standing on the turtle and continually pressing fire or clicking the right mouse button.

THO's afraid of Operation Wolf? Certainly not Janaka Alwis from High Wycombe. No problems on level one. Shoot the animals for extra ammo but watch out for the guys with black berets, they need to be shot twice and throw knives at you if you don't get them straight away.

When two vehicles are near each other fire a rocket bomb in the middle to blow them both up. The red bottles reduce your damage while dynamite blows up any nearby enemies. The free icon gives you infinite ammo and twice the rate of fire for a while.

There are more black berets on level two. Look our for the Rambos who jump and roll across the screen, making them difficult targets. Hit them when they jump in the air. Make sure that you finish with a rocket bomb to spare. To get the boss, aim a little to his right and fire the rocket bomb. He'll blow up but the hostage won't.

You must get through level three without a continue. You can only do this twice, and you want to save them both for later. There aren't too many enemies here, so it's quite easy. The only problems are the unarmed soldiers who come on with one arm cocked back. If not killed straight away they lob grenades at you. These

afinite lives for Sword of Sodan

are a nightmare to shoot down Your damage is reduced

substantially at the end of level three, which is quite helpful. On level four the Arnie lookalikes

have body armour so have to be shot in the head. The black berets reappear. The bald blokes fire rockets at you so they're number one on your death list. Your ammo is replenished at the end of this level

Level five is the hardest stage, even though there are only baldies and black berets. When a hostage appears on the screen drop everything except the mouse and get the guy with the knife who's chasing him. Whatever you do don't shoot the hostages. Your damage will be pretty high - at least it should be if you haven't used a continue yet - so go crazy with your newly-replenished ammo and get as many points as you can before having

to restart the level. The absence of ammo, black berets and baldies on level six make this slightly easier than the previous level, but it's still difficult thanks to the enemy horde who nelt you with hot lead. Unless you have a continue left,

forget it. If you do, be careful with your rocket bombs because you must save two for the very end. Again. watch out for hostages legging it across the screen. Make sure they get across safely.

The bonus round appears once during the game. It's not difficult one rocket bomb will take on three choppers at a time. Aim for the middle one. If you run out of rocket

bombs they will fall from the sky. The final helicopter is a doddle. Keep shooting with the Uzi. If you run out of ammo a magazine will drop from the sky. When the helicopter fires two rockets at you. fire one of your rocket bombs at it.

Do this again and you've made it. If you didn't save any hostages an old man will shout at you. If you get at least one into the plane ... well, see for yourself.

USTIN Gavanovic is more than

just a long name. He's got a fearful disassembler, and this has helped him produce an infinite lives poke for

Sword of Sodan. Type in the routine below and save. When the disc is inserted it won't bring up an error.

REM INFINITE LIVES FOR REM 'SWORD OF SODAN' REM COPYRIGHT 1989, BY JUSTIN 6. REM FOR AMIGA COMPUTING. FOR n=4587528 TO 4589148 STEP 2 READ as a=VAL("&h"+a\$)

PACE: The final front ear has Mr K. Simpson confused. But it's not the game of the Kleenex men, it's Elite, "Just when I'd got completely hacked off with Elite you go and do this to me. Missions? No one told me about missions. Let alone five of them

"So all weekend I spend my time trading - having done one galactic hyperspace - and what do I get. nothing. Help.

'My status is competent, as it has been for ages, I have four military lasers and everything else I can find useful. Thargoids are no problem, yet

I haven't got a mission to complete. "Am I in the right place? Do I have to go to a certain planet to get my mission? I've got a feeling I'm doing something wrong. The manual indicates I might have some

communications with various beings. If so, how? "I love the game, but trading does

get boring after a while. To know that I am missing something is very frustrating, to say the least. Please help.

"Lastly, one tip that no one seems to have found is that if you plonk a military laser at the rear of your ship it gives you absolutely ages to blast

away anything you want while they try to catch up with you. Who needs retro rockets? This may leave you further away from your destined planet at times, but it makes easy work of those pirates"

Well K, missions don't start until you get into the second galaxy. Then you need to hyperspace between 64 planets. So you were nearly there.

UPER HANG ON has the best cheat mode I've ever seen - a machine gun on the motorbike. To activate the cheat mode you must beat the highest score on the current continent's high score table. Africa is fairly easy. As the name, enter "750]". It should change to "....". The cheat mode is now enabled.

To get into the cheat mode screen, hold down Ctrl, Left Alt, Z and T while the attract mode changes from the credits screen to the options screen. The cheat mode screen will appear when you let go of the T and

you will be prompted to enter new coefficients for the road turn effect using the numeric keypad.

Once the cheat mode has been enabled it cannot be disabled, so it is worth remembering that the initial settings are 60 for outer turn and 45 for inner.

The bike gains a machine gun when the cheat mode has been activated. It is used by pressing the left Amiga key. The stream of bullets can be used to destroy other bikes and roadside objects except for checkpoint and goal gates. It is easy to shoot objects you can collide with, so while a Birdland sign is a simple target it is difficult to hit a tree.

There are no special sound effects or explosions because they would be a waste of precious memory and disc snace. Have fun.

INALLY a quicky cheat for Afterburner, Pause the game and type in "together in electric dreams". This is not the same as the ST cheat, and whoever it was who sent in the wrong message deserves to be superglued to the Atari keyboard. A similar fate will be reserved for anyone found stealing tips from other magazines or sending Max The Hax tips to the enemy

# **APOLONIA SOFTWARE &** THE MAD MAD SALE GANG!

THE ULTIMATE SOUNDTRACKER

With this program you're able to edit music-scores in stereo, that you can also build in your own programs. It has got 127 different instruments. Additional you can also sample your own instruments. If you have a song to disk, the used instruments will also be saved to the disk. The great advantage of the program is, that you can edit very long songs, that you can build in your own programs, and that does not use much memory. The quality of the sounds has to be heard to be believed. All these and more in two disks and a mad mad price. ONLY £29.00

# 20,000 Leagues under the Sea

Excerpt from the Coktel Post, 5th July 1867: "Monster of the deep strikes again "The government has fixed the departure date for the famous vessel the 'Abraham Lincoln', helmed by Mr. Farragut who is going off in search of the deep sea monster "The great French professor, Mr. Arommax,

will also take part in the expedition So begins this amazing computer adaptation of Jules Verne's classic novel. Can you succeed where others have failed, and survive what lies ahead - 20,000 Leagues under the Sea?

TO ORDER YOUR GAMES PLEASE USE THE FORM ON PAGE 97 AN you visualise an art program which takes up less than 50k, is intended to be jumped in and out of via the CLI while you do a bit of word processing, has cut-and-paste functions which need one meg to function, which has only the most basic facilities, all for £307 Once upon a time, neither could I.

For your cash you get a disc and a crude photocopied manual with plentiful dot matrix text. The manual explains how the program works clearly enough. Eventually I. mean, it's page 21 before you are told now to load the program, the previous 20 pages being filled with vard qualled of repetition of the Amiga manuals, supposed justification for writing the program—of which more later—and hot air.

On booting up TR Sketch from the Workbench you are shown a window telling you that the program is aliev and well, then a blank screen. Calling up the menu bar displays four options.

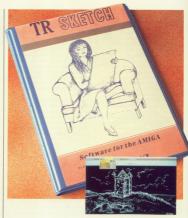

The first, the Project menu, contains the usual file handling options. IFF format – for storing screen pictures is used exclusively, but pictures must be 640 x 200 resolution with eight colours.

More colours? Different resolution? Sorry, not possible. Some demonstration pictures on the disc are silministions. One called The Old Castle is particularly noteworthy – it could easily be mistaken for a Spectrum screen picture. The lack of colour and generous use of blank spaces proves that a picture does tell more than a thousand words.

The Tools menu supplies paintbrush, airbrush and freehand drawing. There is only one thickness or paint density of brush, spray and pen. Ellipses, rectangles and lines can be drawn using rubberbanding, and there is a crude erase option.

Text can be incorporated into your artwork, but you are restricted to the smallest size of the standard font.

I had problems on a 512k machine with the paintbrush; using it tended to make the screen flash, and a crash could only be prevented by frantically clicking the mouse buttons for a few seconds until the menu bar reappeared.

# Back to the drawing board

A real horror emerges from the Australian outback. Alastair Scott charts his chastening experiences with this aboriginal artefact

There is an Undo option in the Edit menu. Draw four lines, press Amiga-U and only the last line will be removed. Better than nothing, I suppose.

Cut and Paste, as mentioned above, only work with more than 512k. The cut part of the screen is unceremoniously dropped on top of the background. There are no options which allow you to AND, OR or XOR it with what is already there. Nor is

there is a Magnify option. In the Extras menu there is, as the name suggests, a collection of leftovers. Incredibly, there is no flood fill. Only rectangles and ellipses can be filled with a solid mass of colour;

there are no patterns. The Join and Snap options do obscure things with complex shapes. Invert, which is completely useless, does just what it suggests to a section of the screen. The Fast Menu allows you to change the current pen, and Palette supplies the usual set of RGB

sliders to alter the colours. Status displays the amount of free Chip and Fast ram, which is supposedly useful if you are multitasking TR Sketch. Last but not least is the most comprehensive section of the program - Help, which provides adequate instructions for every command.

TR Sketch was written in C. Given that compiled programs are on the whole enormously wasteful of memory, the program is tiny and its limitations are painfully obvious. Every command is pared down to the bare bones - beyond in some cases.

The online help is entirely unnecessary, the commands being so simple and obvious that you don't need help after a cursory look at the manual. It would be a good idea to remove it and include some desperately needed enhancements, like a click-to-back gadget for

instance. The most remarkable part of the program is the way the authors note its limitations, turn them on their head and use them to supposedly justify the shortcuts.

TR Sketch is a complete waste of time, effort and money. I'd rather use my Amstrad CPC's Advanced Art Studio - it's 18k longer and 180 times better. Given the graphics capabilities of the two computers, this shows just how inadequate TR Sketch is.

#### REPORT CARD

TR Sketch HB Marketing 0895 444433

£29.95 EASE OF USE..... So simple and obvious that you only need a cursory read of the manual.

Then again, it doesn't do anything powerful enough to need explaining SPEED. The Fill, the only processor hungry

option, takes far too long to do what is 

money. Save up for DP Paint

Its limitations are painfully obvious.

# MAINFRAME TYPESETTING COMES TO THE AMIGA!

AmigaTEX is a powerful new implementation of Donald Knuth's revolutionary TEX typesetting program for the Amiga. Widely used in Universities and research establishments on multi-megabyte mainframes, TEX is capable of producing output of unparalleled quality. In addition to advanced typographic functions such as the use of ligatures, discretionary hyphenation and automatic footnote numbering, TEX handles complex mathematical and scientific typesetting with ease. In fact, the American Mathematical Society has adopted TEX as its official typesetting language - even its on-line databases are encoded with TEX! No other typesetting or DTP software, regardless of cost, can typeset mathematics with such ease. Now this enormous power is available on the Amiga. Using the multi-tasking abilities of the Amiga and the preview facility of AmigaTEX, a document preparation system capable of handling the most demanding typography is available at a fraction of the cost of conventional systems.

AmigaTeX 10 disks £125. Includes TeX, preview, in-iTeX, LaTeX - a macro with preformed style guides, BibTeX, SliTeX, and over a thousand previewer fonts,

BibTEX, SiTTEX, and over a thousand previewer fonts, but no printer driver. 8 disks fT5 Includes drivers for 300 dp; PostScript printers, the HP LaserJet Plus and 300 dp; PostScript printers, the HP LaserJet Plus and Desided Printers.

Espon FX Driver 10 disks fT5. Includes a driver and fonts for the Espon FX Driver 10 disks fT5. Includes a driver and fonts for the Espon FX Driver 10 disks fT5.

that are almost Epson compatible.

NEC P6 Driver 10 disks £75. Includes drivers and fonts for the NEC P6/P7 series of printers and the Epson LQ series of 24-pin printers.

360 dpi Fonts 10 disks £50. Complete set of 360 dpi fonts for 24-pin printers. Needs P6 Driver to use them. ImageWriter II Driver 2 disks £50.

AmigaMETAFONT 2 disks £50. Includes, METAFONT, iniMETAFONT, a screen display program, and source for the Computer Modern fonts.

# AMIGA

#### Why must we suffer?

I FELT totally disgusted after reading the "Piracy is not a crime" letter in your March issue. How on earth can the writer justify what he is doing? I notice that he concludes his letter with an audacious statement, yet dare not have his name published.

If you can't afford something, you have two choices – save up for it or go without. If the anonymous writer opts for the second choice, then the product can't be that important to him. At present he is as low as a thief

I buy one piece of software a month. I read various reviews and then buy what is in my view the game of the month. In this way I build up a small but elite collection of original software. Why can't the pirate reader do the same? Probably because he is very greedy. He must have no conscience at all.

Why must the rest of us suffer for

what he and other software thieves are doing? He must have known when he bought his Amiga — presumably he did buy it — that games would cost £20+.

Craig Thornton,

Nettleham, Lincoln.

#### Speed is of the essence I AM an A level student studying

Further Maths and Physics – don't be fooled, I'm a nice guy really – and as such come across some groovy little alterations like Mandlebrot sets, Julia sets and a few hip mechanic and dynamic formulae.

However, just because I know what the previous sentence meant (Glad someone does. Ed) it does not imply I can program in any language other than Basic, which is almost embarrassine.

I love using Basic, but some pictorial results take upwards of four hours to calculate, which ties up the machine and I can't play Bard's Tale until it's finished. Think of that – four hours without playing a game. How

My inquiries are about speeding up this Basic calculating. It seems I have four choices: Upgrade to a 68010; buy another version of Basic; buy a maths co-processor; steal a transputer from

So my questions are: 1) If I can't run the 68010 and 68000 program before loading a piece of software, how much software will cases to work properly? 2) Which Basic is designed for the types like me, if any? 3) How much are co-processors and how much software uses them? 4) What is the security at Immos like and would an Amiga 500 talk (Ocean?

Finally - was that a sigh of relief I heard? - is Workbench 1.3 software or hardware? Where can I lay my hands on it? For how much and what would happen to my warranty? Mark Cann.

Crawley.

What very interesting questions. Wish we knew the answers. Only joking, but we are going to pull out of two of them because we have articles on some accelerator boards coming up very soon, one of which costs just under £300 and features a 68020 chip with a maths co-processor. Watch out for the reviews, they should make interesting reading.

What you need, Mark, is the HiSoft Basic Compiler. To test it out we wrote a hasty but functional Mandlebrot Set program to do this which took 62 mins 22 secs in

Write to: The Editor, Amiga Computing. 78-84 Ongar Road, Brentwood, Essex, CM15 9BG. We'll send the writer of the best letter each month a program from our goodie drawer. AmigaBasic and only 5 mins 2 secs in HiSoft Basic. The same program, no changes, hand on heart.

HiSoft Basic costs £79.95 if you buy

The Mandlebrot Set

it now. If you wait until the 1,000th copy has been sold – and Dave Link of HiSoft (0525 718181) tells me it's selling well – you will have to pay another £20. Snap it up, we reckon it's a bareain.

Workbench 1.3 is also well worth the money. It's a manual, three discs, no hardware and costs £14.95. Try the UK Amiga User Group (0533 550002)

#### What the doctor ordered RECENTLY I bought an Amiga, 512k

memory expansion and a Cumana disc drive. Being a newcomer to computers I had to do a good deal of reading beforehand. After going through various magazines I decided

to go for the Amiga because its applications suited most of my needs. I have been reading Amiga Computing since last November and have now become a subscriber. The magazine has proved to be the most

useful "software" that I will be needing to learn my machine. Now my problem: I am having

**Diamond Computer Systems Ltd** 6 Gwen Rhian Court, Court Road, Southampton S01 2JS

increasing difficulty in formatting discs. These are unbranded but certified discs I bought in bulk through an advertiser in our magazine. I am having no difficulty in making backup copies on these discs and the programs on them run without any problem.

However, on formatting them the system informs Error Validating Disk or Disk is unreadable with an advice to consult DiskDoctor – which, after a painfully slow process, informs me of a hard error on all tracks and that the

I have used both Workbench and AmigaDos to format them but the result is the same. Yet when I make backup copies on the discs they work well. To make the problem more confusing, at other times the computer formats the discs without any problem.

What is this temperamental behaviour due to? Is there any fault in the discs? When in this mood the

disc structure is corrupt.

behavior due or is there any fault in the discs? When in this mood the computer treats branded discs in the same way. Or is there a problem with the disc drive? It makes no odds if I use df0: or df1.. Is there something else I should know about?

I would also appreciate if in some coming issue you would publish an article about computer viruses and how to save software from being

Navid S. Qureshi, Stirling.

Last question first. Protecting yourself from viruses is easy. Get yourself a copy of VirusX. It's a public domain program that you should ideally run from your boot disc Startup-

It remains in the background checking every disc you put in the drive before validating it. Check out 17 Bit (0924 366982) or AUG (0533 550993) for more details of PD software.

A hard error on all tracks sounds fairly terminal. Are you sure the discs that have given you this message have been reliably usable after reformatting?

The fact that you're having trouble with both did and dif: suggests that your problem is caused by the discs, not the drives. Because 3.5 in discs have hard cases, newcomers to computing are sometimes led into a false sense of security. Had you upgraded from a 5.25 in set up you would know just how important it is to take good care of them.

There are two main problem areas.

AMIGA Lettors

The first – magnetic fields radiated by electrical equipment, typically monitors and TV sets – can erase the magnetically stored information on the disc, disrupting the format at the

It's an awful temptation to stack your discs on the flat top of a TV or monitor – I've even seen stacks of discs on a power supply unit. Nine times out of 10 you'll escape scotfree, it's the 10th time that drains the blood from your face.

The second problem area is less obvious – dust and smoke. The read/write head in a disc drive never comes into contact with the floppy disc surface, it floats a very tiny

distance above.

If you're a heavy cigarette puffer or a bachelor who doesn't know what a duster looks like, smoke and dust particles can drift into the drive when you insert a disc. Said particles can then get between the read/write head and the disc surface, causing the minute scratches which make the disc

Generally you can recover a lot of the information on a corrupted disc using DiskDoctor. Once the doc's done his work you copy everything on to a disc which you know is OK and reformat the dodg you, which usually steamrolls over the hard errors. If it doesn't, get the flame thrower out and turn it into a Blue Peter ashtras.

You must remember to use the Copy command to transfer salvaged files, not Diskcopy. The latter will transfer everything, including the sectors of the disc that have read/ write (hard) errors on them.

Another feature of Diskcopy is that it formats as It goes, which is why your corrupted discs work OK when you Diskcopy other discs on to them. If the source disc is pucka, so will the copy be.

Anyway, the morals of this story are: Always keep at least two backups on separate discs of any important Illes, always store your discs in a disc box away from electrical equipment in a dust-free environment - no, on the pot plant is not a good place - and always use branded, double-sided discs to store information that you don't want to lose.

#### Driving me mad!

THE printer I am using with my Amaga is a Tandy DMF130, which is IBM compatible, and I am having a problem finding the correct printer driver for it. For graphics programs I have to use a driver for the Panasonic 1801 and for word processor type 1802 and for word processor type 1802 and for word processor type 1804 and for word processor type 1804 and for word processor type 1805 and 180

Do you know of any driver that will do the same as both of the others? If not, do any of your readers have the

same set-up as me?

Also, could you tell me where I can get some educational software for my daughter, aged four-and-a-half? She is quite happy using the mouse and is able to load and use Photon Paint quite easily.

V. Langley, BFPO.

We don't know the Tandy DMP130. Workbench 1.3 comes with more printer drivers. We've checked, and yours isn't among them, but you may find one that works better, especially as there is a very detailed section on annual. Here, the Workbench 1.3 manual. Here we would be workbere must have a printer driver tailor made for you.

The Protext word processor comes with more than 20 drivers, including a plain IBM one which sounds like it might work. The trouble is, it's going to cost you E79.95 to find out. Unless you know somebody local who owns Protext? At a computer club maybe?

Protect: At a Computer Cisto Bayber.

#### One for the book

IS there is anything available for assembly language programming on the Amiga for absolute beginners? I may have gone about things the wrong way. I have bought the DevPac assembler along with Amiga Machine Language by Abacus and 68000 ALP by Osbourne McGraw-Hill.

y Osbourne McGraw-Hill. All this valuable and very useful

information is currently going to waste because I haven't the basic building blocks of knowledge needed to begin the write assembly language. Peter Cainey. Exeter.

You need a good assembler, Peter, and DevPac is a very good assembler, but there's no point in owning a powerful tool if you don't know how to use it. Get vourself down to vour local library and dig out some books on how computers work. They don't have to be Amiga-specific, just any old book that tells you how data is

moved around the wires inside. A good book for newcomers to the 68000 - that's the chip you program inside your Amiga - is a Glentop one in the First Steps series. It costs £9.95 and is called 68000 Assembly Language (ISBN 1-85181-081-1). It's not Amiga specific, but it will give you the basic building blocks you're looking for. Once you've worked your way through that one, the Abacus book will make a lot more sense. The Computer Store (021-770 0468)

should be able to get it for you if your local library can't.

#### **Dutch** courage

I NOW and then read your magazin because my friend buys it for his Amiga (A computer that can read? Go on, pull the other one. Who do you think I am, an ST owner? Ed).

The main reason I am writing is that I am an ST owner (Oops. Ed) and I am sick and tired of the "my machine is better than your machine war. As most 16 bit owners have a 16+ age they should stop fighting like children. But your magazine isn't

making things easier In the most recent issue I saw, issue 9, I read several pieces saying - not directly, mind you - what a super machine the Amiga is and what a boo-machine the ST is. When are you going to grow up?

Both machines have advantages and disadvantages. Instead of showing the good points of both 68000 machines an all-round machine for games and serious stuff, something which can't be said about IBM clones - people are

always trying to kill each other Jay Lee,

Capelle a/d vesel, Netherlands. We think "always trying to kill each

other" is a bit strong. We haven't killed an ST owner for at least six months. Gets a bit boring after a while A friend took his Amiga to a local

computer club the other evening. As he walked into the hall a group of ST owners sitting in a corner by the door copying discs poo-pooed him and loudly pointed out to the rest of the membership how inadequate a machine my friend's computer was After a short while he plugged his

Amiga into a couple of self-powered 20 watt speakers and booted Out Run. Guess which machine all the members - including the ST owners were standing around 30 seconds later? We'll give you a clue: It wasn't the ST

Come on, Jav. this is an Amiga magazine. What do you expect us to say? The people who write this magazine live and breathe Amiga. It's what makes Amiga Computing the best Amiga magazine around.

ST & AMIGA COMPUTER WORLD 37 Bamford Street, Clayton, Manchester M11 4FE

Tel: 061-231 6608 (24 hours) G.B. & B.F.P.O. only. Mail order only. No callers

#### **MAKE YOUR**

Yes making money becomes incidental when you know how. Your micro is, if only you knew it, a gold mine. The size and make is irrelevant. Make the initial effort. NOW by starting your own
HOME BASED BUSINESS.

This may be the most important move you will ever make! In so may be un most important move you will ever master REMEMBER! You'll never get nich by digging someone else's "distr". Anyone in the country, including YOU, can become very rich in a reliatively short period of time just by doing a few basic things! It's more rewarding than playing games. The benefits are many and varied. Full or part time. For FREE details send S.A.E. to:

#### HOME BASED 31 PILTON PLACE (AM4) KING AND QUEEN STREET WALWORTH, LONDON SE17 1DR

-------------TWO WAYS TO ENSURE YOU GET

1. Complete and mail subscription form on Page 97

2. Hand this form to your newsagent.

Please reserve me a copy of Amiga Computing magazine every month until further notice.

☐ I will collect

☐ I would like it delivered to my home.

#### TBBCS Bulletin Board Become a sysop for less

If you have an Amiga with two drives and a Haves compatible modem, you could be running your own bulletin board for only 35 pounds!

TBBCS will let you build up a BBS with messages, voting, a dating service, SIGs, downloads, and a CB Simulator for less than the price of most Comms Packages. If you don't have your own phone line, TBBCS can share a voice line.

Send an SAE to the following address for more information Hugh Allan Jr, Ness Castle, Dores Rd, Inverness IV1 2DJ

Only. £79.95 Inc

# A CSA Turbo 68020 For ONLY £295 Inc?

Hard to believe isn't it? But its true CSA broke the price barrier in 32 Bit technology. Now you don't have to settle for a far less capable 68000 accelerator, you can have affordability, capability, and speed in one easily installed package.

CSA's new 68020 Midget Racer Board for the Amiga A500, 1000, and 2000 supports a 68881 or 68882 co-processor at speeds up to 33MHz,

and is available today. Programs like Sculpt & Animate 3D or 4D and X-Cad have been written to directly access the 68020 & 68881, and may not even run with a 68000 based accelerator.

For further information on this and all other CSA products please write to:

In the U.S.A. In Europe. CSA Inc. San Diego CA 92121

7564 Trade Street Jersey Supreme Works 538-546 Whippendell Road, Watford, Herts, Tel:0923 817549

#### ASDG (UK) Announce ProScanLab for the Amiga 2000. ProScanLab allows full control of the

Sharp Colour Scanners, giving full 24Bit colour input and output to the Amiga for Desktop Publishing and graphic editing. The full colour graphic output is compatible with all postscript printers. And can be output as a file for printing by your local DTP bureau or direct to your own Linotronic device. ProScanLab allows editing of the input so you can pick just a small area of your Image for output. If used in conjunction with Gold Disks Pro Page program this allows you full Colour

DTP with 16.7 million Colours output. ProScanLab Board & Software £900 ProScanLab & Sharp A3 Scanner £7500. ProScanLab & Sharp A4 Scanner £3000. All prices include VAT.
