SaxonScript

P · R · O · F · E · S · S · I · O · N · A · LTM

Now Available!

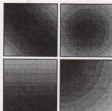

Introducing **SaxonScript Professional**,TM the most powerful and sophisticated **PostScript Interpreter** available on the commercial market. It's like turning your *dot matrix, ink-jet or laser printer* into a full fledged **PostScript printer**, with the added flexibility of being able to edit and manipulate individual files! **On printers equipped with resolutions of 300 dpi or more, the output quality of SaxonScript Professional actually exceeds that of 300 dpi Adobe PostScript laser printers!** Halftoned areas in particular, are consistently sharper, more detailed and feature better transitions between various levels of grey than comparable images produced by using **PostScript**.

PostScript Output at 300 dpi

When pixel values cannot be reproduced exactly, **PostScript** renders the affected pixels in the closest darker shade available at the given screen density. *Subtle details are inevitably lost as a result.* **PostScript** halftones also tend to have a grainy appearance because of **PostScript's** inability to produce irregularly shaped halftone cells.

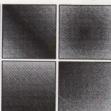

PostScript's approach to halftoning limits the maximum number of possible greys to a function of both resolution and screen frequency. At lower resolutions, this gives rise to the creation of very visible bands of grey which degrade the overall quality of printed images.

SaxonScript Output at 300 dpi

Because **SaxonScript's** algorithms intelligently switch between halftoning and dithering, any pixel value can be accurately reproduced. Notice the greater detail found in this image. **SaxonScript's** images are also sharper and crisper than comparable **PostScript** images because of the program's unique ability to create **irregular halftone cells**.

Our unique approach to halftoning does not limit the number of grey levels which can be printed. Consequently, no banding is visible in areas containing colour gradients. This permits smoother transitions and enhances the overall quality of printed images.

accurate colour proofs on screen. Using the included **moire testing program**, you can also test screen angles and densities for visible artifacts before printing! After verification, **SaxonScript's** proprietary compression algorithms can be used to compress your **PostScript** files into a more compact **PostScript** format for faster, i.e., much less expensive output.

SaxonScript Professional is available at your nearest dealer for only £99.95 inc. VAT! A free copy of **SaxonScript Professional** is also included with every purchase of **Saxon Publisher V1.2**.

FEATURES

- True virtual memory for compatibility with low memory Amigas, or under conditions of heavy multitasking.
- A powerful **PostScript Interpreter** featuring the implementation of all of the standard **PostScript** operations.
- Support for all Preferences printers.
- A standard set of fonts, matching those most commonly found in **PostScript** printers: Avant Garde, Bookman, Century Schoolbook, Courier, Helvetica, Palatino, Times, Zapf Chancery and Zapf Dingbats.
- Support for all **Postscript** downloadable fonts including **Compugraphic**, **Adobe Type 1** and **Adobe Type 3** fonts obtained from any number of different sources.
- **PostScript** font on an Amiga disk can be manipulated within **SaxonScript Professional**.
- Conversion of **PostScript** fonts into **Saxon Publisher**, **AmigaScript**, or **Adobe Type 1** formats.
- A full colour **PostScript** screen preview which is 100% accurate to the limitations of the screen display.
- The ability to convert **PostScript** files into a compressed **PostScript** format for faster output at service bureaus.
- The ability to test screen angles and densities for **moire patterns** before printing.
- The ability to integrate individual separations into a single full-colour document for accurate colour proofs on colour printers.
- The conversion of **PostScript** files into **IFF**, **EPS**, **EPSF**, or **IBD** formats for editing and manipulations in various applications.
- Automatic sensing of 68881, or 68001.
- Implementation of all standard **PostScript** operators.
- An open architecture to allow customisation by PD programmers.
- Delayed printing and print to disk options.

MIN REQ: 1 meg, 2 drives.

H A M - E

Let HAM-E take you away from the Amiga's limited 12 bit graphics and into the professional world of 24 bit images. HAM-E is the most affordable and yet the most compatible 24 bit graphics enhancement for your Amiga. All the software you need is free, even the upgrades! But how can we convince you to buy it? Well, see for yourself...

Hardware Features:

True 24 bit RGB colour guns give you a complete palette of 16.8 million colours, with 8, 18 and 24 bit display modes. 256/512 colour register modes. Displays upto 262,000 colours at a resolution of upto 384 x 560. (Standard Version)
Hi-Res version features custom maths processor for real time anti-aliasing and resolutions of upto 768x560 pixels. Full Genlock, PAL Encoder and Modulator support.
HAM-E doesn't take up any processing time.
Treat HAM-E pictures and animations as standard IFF files. Can display both HAM-E and standard Amiga screen modes on your monitor simultaneously.
Display HAM-E images in DPaint, AmigaVision, Scala, AMOS, and of course Cando etc.

Image Professional Features:

Very powerful 24 bit processing features. eg. RGB correction, melt, antique, caricature, droop, explode, radial wave, motion blur, zoom, etc.
Everything computed with 24 bit accuracy.
Multiple buffer and undo functions.
Display modes include 256 colour, average and luma (b/w), 18 bit and 24 bit colour.
Special mode to import directly from Digiview.
New 24 bit paint and brush functions. Allows full 24 bit painting and brush manipulations, all at full 24 bit resolution, upto 32,000 pixels square.

"Paint" Features:

Draw, line, circle, box, etc, and complete fill modes, with full light source shading.
Extensive brush and fill control menus.
Fast brush distortion in any shape.
3D perspective and AREXX control make complicated animations possible.
10 colour cycle/glow ranges.
Anti-alias, wash, bright, cycle, etc... draw modes.
Both IP and Paint packages fully support standard Amiga fonts including colour fonts.
Full 24 bit palette control screen, allowing large number of multi coloured ranges.

Third Party Support:

Spectrator from OXXI - Full HAM-E support. 262,000 colour animated brushes!
Art Department from ASDG inc. Full HAM-E load and save support.
Vista Pro from Virtual Reality Laboratories - Now includes 24 bit HAM-E rendering.
3D-Professional from Progressive Peripherals inc - Now renders direct to HAM-E.

Commodore takes Amiga RISC

AMIGA
exclusive

New Amigas are on their way.

Commodore opens up to John Butters

THE FIRST of the next generation of Amigas using some of the most up-to-date technology available will go on sale in less than a year, Amiga Computing can exclusively reveal.

Commodore have admitted that they have two options under test at their secret Pennsylvania development plant and an insider says that at least one of these will be marketed. They centre on two powerful chips which lift the computer's speed considerably, and there will also be improvements to the sound and colour.

The first of the new Amigas will be an upgraded A3000 but it is unclear whether it will be a replacement or another machine. The A3000's 68030 processor will be exchanged for the faster 68040, making it up to five times faster than the existing model and 20 times quicker than a standard A500.

The new version of the top-end Amiga will be on sale by next August and possibly earlier. Owners of the current A3000 will be able to buy an upgrade chip which will plug into the separate Central Processing Unit (CPU) slot for enhanced processors. Other machines in the Amiga family could see the processor later, say Commodore.

The manufacturer has also developed an Amiga based on the Reduced Instruction Set Chip (RISC). RISC is designed to have few instruction commands, thus enabling it to pass through code quickly and increase the speed of the computer. The chip was designed by Acorn Computers and is used in their Archimedes, which has become popular in education.

Developers have been slow to accept RISC, although an independent expert told us that major players in the industry are moving to the chip, including Apple who are set to build a Macintosh running from it.

If developed as a product, RISC will be used in all Amigas, says our source, and could be only a year away. But the firm is unwilling to discuss its exact specifications. "I can't actually make a

comment on the RISC-based system at the moment, said a spokesperson.

He added that the improved sound will probably be 16-bit, and a chip set due later this year will give a larger palette and 256 colours onscreen at once, effectively giving a VGA standard

display. The RISC and 68040 chips could lead to incompatibility problems, although RISC would give the biggest headache to developers.

But Commodore have guaranteed compatibility with existing software. "It will run the Amiga operating system - our policy has always been to maintain and develop Amiga technology," said Commodore.

One way around the RISC problem would be to include a 68000 processor inside the machine. Another would be to have "very sexy programming" across the bus that would allow the RISC processor to access the Zorro data bus.

The A3000 will be the first Amiga to be fitted with a 68040 chip. The processor will also go on sale as an upgrade, plugging into the CPU slot

Cheap speed arrives

A STAFFORDSHIRE distributor is set to release a cheap card in a new line of accelerators.

The entry-level VXL-30 will fit into all types of Amiga and could go on sale for less than £300. Based on the 68030 enhanced chip set, the MicroBotics accelerator will run at 25MHz.

It will not have extra memory but accepts an optional 32-bit ram board, VXL RAM-32, populated with either two or eight megabytes of Fast Page Mode ram designed to enable the processor to operate in its high speed burst mode.

A software switch will return control to the Amiga's 68000 chip, enabling all software to be compatible with the upgraded computer. Available from ZCL (0543 414817), VXL-30 will probably cost £299.99. The price of the ram boards has still to be fixed.

Workbench upgrade by Xmas

THE REDESIGNED Amiga operating system is being burned into rom and will be on sale by the end of the year say Commodore. An official announcement of the release is expected soon.

Already supplied on disk to owners of A3000s, Workbench 2 has a new appearance, and grey, black, blue and white have been substituted for the original colours.

Other features in version 2 are improved error handling that finds software failures before they manage serious damage, and quicker floppy disk operations as a result of the new Fast File System.

Arexx, CompuGraphic fonts and utility software come with Workbench 2 and the Enhanced Chip Set will also be available and fitted by an approved service centre. Users not requiring either the Super Agnes or Super Denise

chip will pay less for the upgrade, it is claimed.

Despite the operating system being completely rewritten, incompatibility will not be a serious problem, although industry experts say very old commercial programs and some public domain software could cause trouble if they were not written to Commodore guidelines.

It will primarily be targeted at A2000 owners and it is unknown

Amiga owners will soon be able to upgrade

whether A500 owners will see an upgrade. Statistically, Commodore are selling one megabyte A500s fitted with the latest operating system and the Enhanced Chip Set in a computer known as the A500 Professional. If the A500P were to become a UK product then an upgrade would be unlikely.

Commodore's Andrew Ball told Amiga Computing that upgrades will filter through to the UK by the end of the year but probably not for the A500, although other staff at the firm's Maidenhead office said it would be "technically possible" to supply chips for that model.

Roms will be supplied with a comprehensive manual, and a price tag of between £75 and £100 seems likely. Disk-based copies are not expected to cost more than £25. Commodore were unwilling to confirm prices.

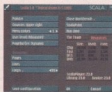

WHAT'S new

Slicker Scala from Silica

TOP-SELLING Amiga presentation package Scala has had its features expanded for video titling, multimedia and presentation production.

New features found in version 1.1 of Norway-based Digital Vision's program include ARexx support, real time anti-aliasing of text, brushes and colour fonts and continuous credit scrolling transition.

Anim real-time buffering will load the next animation as the previous one is being run, and other features include colourfont support.

Scala has undergone various improvements

full support for outline fonts under Workbench 2.1 and automatic remapping of brushes and colourfonts.

There is also superimpose transition, a function to show layout boxes, much faster loading and automatic popularity buffering which stores many pictures in memory for use with interactive applications. It has 17 high quality fonts, 59 backdrops, 52 screen wipes and 50 text line wipes.

"Since its launch, Scala has become Silica's best selling Amiga presentation package – outselling every other presentation package for the Amiga," said Silica's Andy Leaning.

"The new features give the package an improved running speed and make presentations slicker and more professional."

The package is compatible with all Amigas and costs £264.38. Users of the earlier version can upgrade for free by returning their original disks to Silica Systems (081-309 1111) at 1 to 4 The Mews, Hatherley Road, Sidcup, Kent DA14 4DX.

Dealers to give multimedia advice

AMIGA buyers will be able to get more advice from dealers about the computer's multimedia talents, thanks to a new nationwide network of multimedia centres being set up by Commodore.

All will be in place within three years and the manufacturer intends to open at least one every three months.

Dealers will be invited to undergo Commodore training which will include courses in sound and graphics, presentation, design, genlocking and animation. Another part of the training will be with distance learning packages.

Said Commodore's national sales director Terry Cooke: "Commodore is

the only supplier to operate in all market sectors of this fast growing market. Our figures project market growth of 72 per cent per annum over the next four years.

"Our aim is to marry our expertise with Amiga technology, which exists with certain dealers right now, with our own commercial marketing experience and the expertise of the individual components of the multimedia mix.

"Multimedia is an added-value market that many dealers are keen to enter – we have made that transition easier. We realise it is not about a single technology but about applying solutions to needs and that's what the training achieves."

Commodore's technical director Barry Thurston announced that the firm will be 'working with all key dealers to give multimedia solutions to the marketplace'

Pilots get learning aid

AMIGA owners will soon be flying high with two versions of a realistic flight simulator featuring three types of light aircraft just announced by Bristol-based R C Simulations (0272 550900).

Under development by Digital Aviation, Light Aircraft Simulator will offer everything from basic training to aerobatics. Airfields throughout southern England will be represented in faithful detail.

Flights in a single-propellered Cessna 150 or two models of the Chipmunk, a favourite Royal Air Force training plane, can be taken to 100 destinations within the UK. Software will be supplied with a comprehensive manual to include navigation maps.

R C Simulations chairman Bob Sidwick says the programs will give an ideal environment for practising flight instrument appreciation and general navigation techniques including visual and radio navigation approach procedures.

The simulator was designed to aid in the training of private pilots and should be on sale by the end of December.

The visual only version will cost £49.95 and the instrument flying version £90.

Typesetting system enters UK

A PROFESSIONAL Amiga typesetting system has been officially released in the UK by Industrial Might and Logic (0273 621393) and at the same time has received an update.

AmigaTEX enables interprocess communication with other programs using ARexx and includes equations and tables, as well as a document size determined only by the size of the hard disk. New features found in version 3.1a include full PostScript and graphics support onscreen and to supported printers, and AmigaDOS 2 compatibility.

PostScript fonts from various sources, including nearly all structured drawing packages, can be scaled, slanted and stretched to any degree and graphics can be integrated into AmigaTEX documents and appear onscreen exactly as they will be printed.

It sells for £140, and a free demonstration disk is available by writing to the firm at 58 Cobden Road, Brighton BN2 2TJ.

Disks for free **AMIGA people**

A CLEVELAND man who has formed an Amiga public domain library, which he says will encourage users to decide how they want it to serve them, is giving disks away free.

Paul Fales, 23, started full time work on Neural Images PD (0429 263508) after owning an Amiga for more than a year and recently being made redundant from an accounts job at Rolls Royce.

Paul says he wanted to run a library but kept his Amiga as a hobby until he lost his job, when he had the time needed to start the business. As part of an opening promotional campaign Neural Images will supply any disk from a catalogue of 150 free until the end of September.

By including a questionnaire with the catalogue he hopes to be able to carry out market research into what his customers want. All models of the Amiga

Paul waiting for a flood of disk orders

will be catered for and as part of the library's policy of being user friendly, programs requiring more than half a megabyte of memory will be published in a different section of their catalogue.

Orders will be dispatched the same day and before each disk is sent it will be checked to ensure it works and is virus free. After September, each disk will cost 99 pence plus postage and packing.

Although many small Amiga libraries have been forced to close in the last year, Paul thinks there is enough space for Neural Images to move in. "By offering a good service at low prices there is room in the market for the library. It will be speedy but not at the expense of quality and I want Amiga people to tell me what they want," he said.

SAMPLERS & SEQUENCERS EXPLAINED

SAMPLE

A sound that has been loaded into a computer, and is represented by numbers (digital) rather than noises (analogic).

SAMPLER

Usually a small cartridge that allows you to take sounds from a microphone (with amplification), tape, CD etc and record (digitise) them into your computer's memory. Once in the memory a sample (sound) can be changed using the sampling software.

SAMPLING SOFTWARE

Allows you to alter sounds that have been digitized by the SAMPLER. Normal functions with sampling software include loading and saving a sample to disk, altering the sample by cutting, speeding up/down, fading in/out, panning to other samples and much much more.

SEQUENCER

A sequencer allows you to take samples and play them back in an order (sequence) that you determine. For example, if you sampled a piano note, a sequencer would allow you to play that note back at different pitches and in a sequence you decide. Your one note loaded into a sequencer can become a complete piece of piano music.

Our top level sampler for the Amiga 500/2000 and 1000 (Special offer) combines top of the range electronics with a sensible price. Our unique wedge shaped cartridge includes a built in MIDI interface (in/out & thru) eliminating the need to swap between sampler and midi interface. Other ports include microphone input and phone in & out. Our software is a "sampling package" as described by AMIGA WORLD magazine, and incorporates a state of the art editing suite with virtually every feature you'd want to lay your hands on. A separate MIDI control panel allows utilisation of the built-in interface with the possibility to bring back up to 100 different samples (also stored on your MIDI keyboard. Don't think AMAS is a toy either, our price policy brings high quality products to you at sensible prices. Used by studios and professionals AMAS was featured by Paula Abdul in her award winning video Card Hustle!

Cartridge, software & manual £99.95

Our mono sampler is low in price but high in features. Our stylish cartridge for direct connection to your parallel port (it has a built-in mono buffer in socket suitable for input from the headphones socket on your Walkman, cassette or CD player. Full feature editing software includes cut, paste, fading, filters, scope, graphics, equaliser etc. and MASTER SOUND even has its own built-in mono sequencer for real time recording of your own music sequences. "AMIGA FORMAT" magazine said "It produced some of the best quality samples I have ever heard". If you are looking for a low cost sampler that's packed full of features then look no further.

Cartridge, software & manual £39.95

This sophisticated sequencer allows you to take samples and sequence them with ease. Imagine your samples as a line with QUARTET as the conductor. Your bank is composed of 16 instruments of which 4 can play at any one time. QUARTET comes with 100 instruments and sounds for inclusion in your own compositions and further sounds can be added using AMAS. MASTER SOUND or most other quality samplers. Music can be input from the Amiga keyboard, by mouse or if you have a synthesizer keyboard with a midi out socket by plugging in the keyboard. Control of samples includes: Tempo, Volume, Pitch together with a built-in editor for changing samples without editing QUARTET. Who knew you could edit so brilliantly. "Amiga" or "Amiga" with this highly acclaimed package.

Software & manual £49.95

Our low cost MIDI INTERFACE provides the easiest way of hooking up your Amiga to a Midi Music Keyboard. Complete with cables that just plug straight into your INPUT midi ports and a disk of Public Domain midi software.

Midi Interface £24.95

Dealers win returns battle

DEALERS are praising Commodore bosses for axing their new cost-saving returns policy within days of it taking effect. The decision was taken when dealers threatened to cripple the supply of Amigas by dropping it in favour of rival machines.

From July 1, dead on arrival (DOA) products had to be returned to Commodore's National Repair Centre at the dealer's expense and they were told they would have to wait for up to 14 days for replacement machines.

Furious retailers claimed that when the new policy was introduced the Amiga failure rate leaped much higher than the normal eight per cent and it took longer than two weeks for new computers to be received.

Despite a half per cent increase in their margins under the policy, dealers claimed they were losing money and could not afford to continue stocking the firm's products.

Talks between Commodore and dealer body NASCR (The National Association of Specialist Computer Retailers) resulted in the policy being reversed and distributors taking back the responsibility of handling DOA micros.

"The returns policy will practically revert back to the way it used to be - the only minor change is if a dealer finds shortages in the box," said NASCR chairman Clive Bishop. "Where it was the responsibility of the dis-

tributor to replace those shortages it will now be Commodore's direct.

"Commodore made a statement at a distributors' meeting prior to its announcement that if there was major adverse reaction from the trade they would be quick to react and back down.

"On that basis that is correct, they've done that and I commend them. The mere fact that they overreacted in the first place is water under the bridge now. There will be a major sigh of relief across the UK."

Commodore say distributors must now be much more responsible and operate to DOA guidelines to avoid abuse of the system. A spokesman said that for bona fide dealers the policy remains the same as it used to be.

Meanwhile, an independent survey has found the Amiga to be the country's most stocked leisure computer, with the A500 available at more than eight out of 10 outlets.

In second and third place in the Computer Trade Weekly survey were Sega's Megadrive and MasterSystem, both sold by more than 70 per cent of dealers. In fourth place was the C64 at 70 per cent, and in fifth was the Atari ST, on sale at 65 per cent of outlets.

RAF take off with ProFlight

VISITORS to this year's Royal Tournament had the opportunity to take to the sky in one of the RAF's most advanced front line fighter planes thanks to an A3000 and a leading flight simulation program.

An organiser of the promotional show at Earls Court stationed at an RAF Henlow suggested that HiSoft's ProFlight program could be demonstrated at this year's two and a half week event.

A special version was programmed which enabled the pilots to follow missiles, and to add reality users sat inside the cockpit of a real Jaguar aircraft. Movement was controlled using the new R C Simulations Gravis Stick yoke.

The display was projected on to a wall-sized screen outside and a navigator sitting nearby acted as co-pilot, taking instructions through a headset for anything other than the Tornado's movement from the budding pilots.

Prince William and Prince Harry were among the visitors taking a trip up to Mach 2.

Diamond open in London

ONE of the country's largest Amiga dealers are set to open the doors of their first central London showroom.

Southampton-based Diamond Computers (0703 232777) are to have their Tottenham Court Road premises officially opened by a celebrity and have promised to devote an entire floor to the Amiga.

Called Amiga World it will have a range of hardware and software products and will be backed up by a second floor of general computer peripherals such as printers and modems.

Marketing manager Jonathon Shirlow said his firm chose that specific London road because it is the Mecca of the computing world. He said it will offer quality products and a pleasant shopping environment without high prices.

The London showroom will open six days a week between 9am and 6pm and can be telephoned on 071-453 0434.

A Star is born

A SUCCESSOR has been announced for Star Micronics' (0494 471111) ageing LC-10 dot matrix printer. The new entry level 9-pin model is targeted at home and small business users.

The LC-20 has a draft print speed of 180 characters per second and has eight near-letter quality fonts including italics. Other features include a 4K buffer, push tractor feed with short form tear off, paper parking and Epson and IBM emulation.

A star spokesperson described the printer as robust and said its looks are in keeping with current design trends. It has an RRP of £233.83.

A new range of colour printers has also been released by the giant for professional users. The four machines in the Pro-to-Col series are mixed between 9 and 24-pin models and cost between £399 and £599.

The LC-20, flagged by Star as the LC-10 for the 90s

WHAT'S new

Video to run on Amiga

ANOTHER multimedia program heading for the Amiga is Super Video Amiga, a solderless plug-in board that will enable live television or video to be watched through a monitor and grabbed for use in other applications.

The display will be a digital 24-bit image and there will be controls for volume, balance, bass and treble. The image is shown within a window which can be made any size on the screen and allows a graphic or text overlay.

Frames can be frozen and saved in common file formats for use in applications such as desktop publishing or sent by modem to another machine. It will require at least two megabytes of memory and is hoped to be priced at less than £500. Contact SAI Technologies on 081-566 6677.

Show off!

EMAP EXHIBITIONS (071-404 4844) made the shock decision to lock the public out of this year's European Computer Entertainment Show less than a month before it is to be run, from September 5 to 8.

EMAP's sales manager Ken Crossland told Amiga Computing that the show has been relaunching as a trade-only show because the trade side of it was proving far stronger than the consumer side.

Radio announcements on a London station and advertisements in the computer press will beg people not to go to Earls Court for the four days. EMAP says more companies are now planning to attend.

Among the exhibitors are Commodore, who say they are now re-thinking their strategy for the show. "It's a shame that CES hasn't happened because it has always been a show to promote our products but it will place a great deal more importance on the Commodore Show," said Commodore's Andrew Ball.

Printer winner

THE WINNER of the Amiga Computing competition at the 4th International 16 bit Computer Show was Mr Ryder of Palmer's, Weymouth, a Panasonic KX-P1124i dot matrix printer is with him and working hard already.

WHAT'S new

Monitor takes off

AS PART of a promotional campaign Philips (081-689 4444) are bundling Microprose's flight shoot-'em-up, F-19 Stealth Fighter, with their CM8833/II colour monitor.

Buyers also have the opportunity to enter a competition to win one of 33 flights at the controls of a Boeing 737 simulator. Three winners will have lunch at a top country manor hotel, with helicopter transfers to and from the Britannia Airways simulator at Luton Airport. Competitions will be held during October, November and December.

A Philips spokeswoman said F-19 was chosen after looking at quite a few software packages and finding that flight simulators were popular and broad-ranging. Microprose were the specialist in that market she said.

The bundle costs £269.

Gasteiner goes cordless

A CORDLESS memory upgrade and mouse are among a line up of new products set to be added to the Gasteiner Technologies (081-365 1151) range.

The Alfatada memory expansion has a fitting for inside the computer and communicates "like remote control" with the extra memory which can be put nearby, in places such as a desk drawer.

The price of the four megabytes of memory has still to be fixed and it is due on sale by October.

Mega Mouse is an optical rodent with a resolution of 300 dots per inch. Supplied with a solid pad and mouse holder it has a two year guarantee. It boasts a tracking speed of 600 millimetres a second, an ergonomic design and three microswitch buttons. No price has been set but it is to be available soon.

A new gimmicky pointing device is due for a Christmas release from the London-based distributor.

Crystal Trackball will operate like a normal trackball but whenever one of its three buttons is pressed the unit illuminates, its colour determined by which button is used. Gasteiner say it will probably sell for £39.95.

Cologne gets world's best show?

AN EVENT being flagged as the world's greatest Amiga show is to be held in Cologne, Germany at the beginning of November.

The organisers promise that four halls of the Kohn Messe will be packed with more than 200 exhibitors from across the world for the show. Amiga 91's doors open on October 31 for trade and press visitors, and the following three days will be available for anyone interested in the Amiga.

Each hall will have a special theme. Hall 5 will contain professional hardware and software, Hall 6 will be devoted to hardware, entertainment will be featured in Hall 7 and for those interested in public domain, music and mail order, Hall 8 is a must.

There will be an exhibition of computer art, where visitors interested in graphics and art will be able to view the graphics capability of the computer and beginners' workshops and master classes.

For more information call organiser AMI Shows Europe on 010 49 8092 24086.

Silica links with GVP

A DEAL has been struck between Silica Systems (081-309 1111) and Great Valley Products to make Silica the official UK distributor of the American giant's Amiga peripherals.

The world's largest third party supplier of Amiga hardware, GVP's range includes hard disk drives, cards and accelerators and caters for owners of all Amigas.

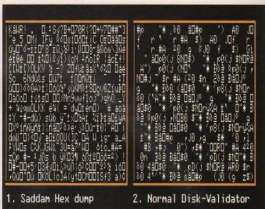

Among the products are a 52 megabyte A500 hard drive and ram upgrade selling for £599, and an A2000 hard card and ram upgrade with various capacity hard disks and ram sizes with prices starting at £199 for the interface.

"This arrangement means we have

access to the best Amiga hard disks, accelerators and cards - GVP's Amiga peripherals are unrivalled", said Silica spokesman Andy Leaning.

"The joining of the two companies will give UK Amiga users access to unmatched products and support. You can now buy the very best products, safe in the knowledge that you are assured of the best in support and assistance".

Leaning also hinted that under the deal Silica will be responsible for handling American firm Lake Forest Logic's products, who were recently taken over by GVP. Great Valley adopted Lake Forest's range which includes The Disk Mechanic, ADAPT and Macro Paint.

A hex editor's view of the normal disk validator and the Saddam virus file

Saddam virus scare

A NEW virus called Saddam threatening to ruin thousands of Amiga disks is almost invisible to virus checkers.

Writing itself to the disk-validator file in the L: directory it is disguised by being the same byte size as the validator and will prevent commercial games and other software from running.

Infected disks are unable to auto-boot because code is forced into the first line of the start-up sequence and it is also suspected of causing read and write errors. Unlike most viruses, Saddam enters the Amiga's memory whenever an infected disk is put into the drive and does not wait for it to be read.

Amiga Computing's technical expert, Stevie Kennedy, put the virus under the microscope. "We first spotted the virus after looking through a batch of PD disks", he said. "KDVIH's 30 second vector checker started to go bananas, so we examined the section of memory it reported as suspicious. A wad of code was found with the word Saddam firmly embedded in it.

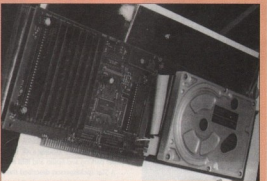

"As far as we know, the virus will completely destroy the infected disk when activated, though the circumstances under which it will pop into life remain unclear. The only way to detect Saddam is to have a virus killer which carries out continuous vector checks.

"If readers already have KDVIH, which we gave away on the March CoverDisk, they should be able to spot the virus before it spreads any further, but the best way to deal with it is with version 5.23 of John Veldthuis's Virus Checker".

The program recognises the virus in action and comes with a new program called FixSaddam, which rescues damaged data blocks from a disk infected with the virus.

Data from destroyed disks will not be repaired but if you are using Virus Checker or KDVIH you should have enough advance warning of Saddam's presence to be able to disinfest the disk before it is irreparably damaged.

Readers should be able to pick up a copy of Virus Checker from one of the better PD libraries but we may include it on a future CoverDisk.

Some GVP products were formerly available from Power Computing. The new deal makes Silica the official distributor for GVP's entire range of products, including the A500 52 megabyte hard card with eight megabytes of ram

Evesham joins in BBC charity

IT WILL be up, up and away for 10,000 balloons at the end of November, when Amiga dealer Evesham Micros (0386 765500) release them in a bid to raise £10,000 for this year's BBC Children in Need charity event.

The Mighty Balloon Marathon will offer customers the opportunity to win an AS500 with a colour monitor and the winner will also receive an Atari Lynx hand-held games console.

The balloons, each costing £1, will be launched from the BBC Pebble Mill studio near Birmingham on November 22, with a name and address tag attached to each.

Once a reasonable period of time has elapsed, the company will announce which balloon travelled furthest to become the winner. The firm are taking donations at any of their showrooms or by telephone. A few weeks after the sales started Evesham boss Richard Austin said they were likely to overtake their initial aims.

Amiga Computing and other Eurposet Publications are supporting the Evesham Micros event. A free advertisement will promote the campaign in the November issue of the magazine.

Organiser, Richard Hicks, told Amiga Computing: "We are confident of getting a good response and hope to add to the excitement and fun in our region".

Printers go two-tier

PRINTER owners with both laser and dot matrix models will have space problems cured with a new development from Rexel. The Two-Tier Printer Stand holds the two types of printer at once and is available for £133 from Intercom Computer Supplies (0800 333 333).

Ideal for computers

THE ORGANISERS of next year's Ideal Home Exhibition are to devote a section of the show to home computing. The Ideal Home Computing Show is a new feature of the event and will be held during the last weekend of the exhibition.

A spokeswoman said: "With more and more people working from home, the home computer has become a necessity."

The 1992 Ideal Home Computing Exhibition will be held at Earls Court Exhibition Hall from 4 to 5, and will be open until 8pm daily.

Public gets a show

SOON after the EMAP announcement that this year's CES had become trade only, details of a new retail show became available. The Computer Market Show will be aimed at computer users shopping for computers, software and consumables at low prices.

Show director Andrew Cooke said: "There is going to be a superb range of exhibitors showing the latest software and PCs."

The venue for the three day show is Birmingham's Rex Centre (021-773 9090), near Birmingham's New Street Station. It will be open from 10am until 6pm on October 11 and 12, and 10am until 5pm on October 13.

CDTV move

CDTV OWNERS should soon find software using the machine's full potential following Commodore's appointment of multimedia pioneer Jim Mackenzie as general manager of CDTV development in Europe.

His main role will be to aid CDTV publishers and developers in European markets and will foster development in education, leisure and business applications.

Mackenzie has been working for the Maidenhead-based computer giant as a multimedia consultant since early last year and was a key player on the CDTV project team.

Stephen Franklin, managing director of Commodore, said: "Jim Mackenzie is one of the UK's leading experts in multimedia and we are very glad to have him at Commodore".

Jim Mackenzie: "I've long believed that CD technology was going to have a profound impact. It is clear that with CDTV this is now a reality".

AddXtra from number one dealer

MIDLANDS-based dealer Centresoft (021-625 3388) have been voted the number one software distributor in a recent survey by trade newspaper Computer Trade Weekly and have announced new Amiga peripherals.

The AddXtra range will be made up of several new types of product. A disk drive anti-click device designed to remove drive noise will sell for less than £10.

There will also be what the firm describes as a fun mouse which will switch between Amiga and Atari ST operation, a rom switcher to change Amiga 1.3 software to 1.2 and vice versa, and stereo headphones and an adaptor for plugging into the serial port.

Also imminent is an Amiga joystick and mouse switcher containing three ports for operation of two joysticks and a mouse. Half megabyte ram upgrades are available with or without a clock and the games Champions of Kyrin or Kick Off 2. A 1.5 megabyte upgrade including clock is also available.

Managing director Richard Steele: "Centresoft intend that the AddXtra range of products will fast become the standard accessory for all different types of playing machine."

"Our aim is that AddXtra will stand for quality, value for money and power packed with extra value".

WHAT'S new USA

Report by Denny Atkin

Commodore lay-offs

It was the most upbeat time for the Amiga in recent memory. Commodore's Power Up program – which offered discounts of more than \$1,000 on the Amiga 3000 to anyone who could produce a manual cover and serial number from any Commodore machine, from the Pet to the A2500 – was a massive success.

Power Up had Amiga 3000s back-ordered in the thousands. Meanwhile, NewTek's Video Toaster was quickly making the Amiga 2000 a *de rigueur* choice for video professionals and hobbyists – a professional market was finally taking the Amiga seriously.

And more games were pouring out for the A500 than ever before. In general, most of the professionals in the Amiga market seemed quite happy.

Until Black Wednesday, that is. At about midday on July 31, Commodore announced that they were discontinuing the Amiga.

Users and developers alike justifiably wondered about Commodore's commitment – and common sense – when the company cut back the already small Amiga development team. While the

was confirmed at press-time, sources within Commodore said that about 12 people involved with R&D had gone.

Perhaps the most significant lay-off was in Commodore's UNIX R&D group. The group had just finished the 2.0 release of Amiga UNIX, and were set to begin working on version 2.1, which will be compliant with the new ABI standard.

Now, only one person remains working on UNIX 2.1. Two others were transferred to Amiga development, and the rest were made redundant. It seems as if they're giving up on UNIX without giving it a reasonable chance to become profitable.

Online panic

When word of the lay-offs leaked to the online telecommunications networks, you'd think Commodore had announced that they were discontinuing the Amiga.

Users and developers alike justifiably wondered about Commodore's commitment – and common sense – when the company cut back the already small Amiga development team. While the

cutbacks are disturbing – most companies Commodore's size have much larger R&D budgets and development groups – it's not time to panic.

There are still more people working on Amiga software and hardware development than there were in the Amiga's early years, and rumour has it that Andy Finkel may have gone to work with the CDTV development group.

While 85 per cent of Commodore's sales are in Europe, it's disturbing to see these R&D cutbacks in the USA, since operating system and hardware development for all of Commodore's Amiga markets is done here.

The company may be looking for quick ways to make the bottom line look better, but you'd think that by now Commodore would have figured out that the long term is extremely important in the computer industry.

If they're still trying to sell the same old Amiga 500 and 2000 models a year or two from now, while everyone else is putting in R&D money to create better, faster, more graphically exciting computers, the company will be in deep trouble.

Profits up

When Commodore released their fiscal year 1991 earnings reports, Irving Gould was quoted as saying "In the coming fiscal year, we will redouble our efforts to expand and enhance our line of products, pursue new market opportunities, and gain further operating efficiencies worldwide." We can only hope that the third goal doesn't overwhelm the first.

Commodore recently reported that their earnings were up for the fiscal year ending June 30, 1991, with earnings of \$57.4 million on an income of \$1,047.2 million. In comparison, FY1990 saw earnings of \$1.5 million on sales of \$887.3 million.

Former Commodore US chief executive officer Jack Rattigan took home a \$9.2 million chunk of those FY1991 earnings, thanks to his settlement with Commodore for a breach-of-contract suit when he was fired a few years back.

Visual impact

There weren't many new products introduced at the recent AmiExpo show in Orlando, Florida.

The most exciting new product on display at the show was GVP's new Impact Vision 24 graphics card. At \$2,199 retail, this is a card for only the serious graphics aficionado. However, if you're in the market for a 24-bit graphics card, it's hard to imagine one with more options.

Both PAL and NTSC versions of the board are available. Impact Vision is the first card that plugs into the in-line Zorro III and Video slots in the Amiga 3000; if you're installing it in a Zorro slot and run a cable over to the video slot.

The frame buffer display supports a 16-million colour display with full video overscan (768 x 625 in PAL mode), and is software switchable between PAL and NTSC. There's also a double-buffered 12-bit 4096-colour display mode suitable for animation.

Impact Vision's nearest feature is its built-in de-interlacer. Used with a VGA monitor, Impact Vision de-interlaces not only its own display, but all standard Amiga modes as well. At the moment, it's the only display enhancer for the Amiga that supports de-interlaced output.

Other Impact Vision features include: a real-time 24-bit RGB frame grabber that can freeze video or grab a single frame in 1/30th of a second; Picture-In-Picture, which allows you to view a live RGB video source in a window, surrounded by 24-bit graphics; both composite and RGB output in PAL and NTSC; and composite and RGB genlocking.

It's bundled with Macro Paint-PVA, a 24-bit paint program; Caligan-PVA, a special single-light-source version of the 3D rendering program; and Scala-PVA for video titling.

Depending on your video needs, the Impact Vision 24 board may be new enough to stop waiting for NewTek to release a PAL version of the Video Toaster.

Innovatronics introduced Directory Opus 3.0, a commercial version of Jonathan Potter's shareware directory utility.

DeluxePaint IV was shown publicly for the first time, and the crowd was suitably wowed. New Horizons showed off DesignWorks, their new structured drawing program, and Cryogenic Software introduced the new 2.0 version of their 3D professional modelling packages.

More information will follow on these products as they're released for review.

More found in 2.4

According to reports from developers who have received final disks and roms for product testing, there's a little more in Workbench 2.04 than many had expected.

It seems that Commodore did get their outline font technology completed in time for release. One of the disks that will be included in the 2.04 Enhancer package will contain a special outline-capable diskfont library, three scalable Compugraphic fonts, and a utility called Fountain that will enable you to create bitmapped fonts from the outlines, and convert GDI's Compugraphic font disks for Professional Page so they can be used with AmigaDOS.

The outline fonts can be scaled to any size and will still maintain a smooth, professional appearance. AmigaDOS 2.04 will also scale standard bitmap fonts, but they appear chunky if they're enlarged too much.

Crack epidemic

Though not a problem on the scale of the professional duplicators running full scale piracy operations, the activities of "crackers" have come to worry software houses a great deal. Working in groups, and sometimes liaising with others on bulletin boards in Europe and overseas, crackers are often experts in software protection routines and how to break into, or "crack" them.

They compete with each other as to who can crack a game the fastest, the current record belonging to whoever uploaded *Psygnosis' Lemmings* to a popular bulletin board before it was released to the public.

This sort of competition, though very much of the "mine's bigger than yours" school, spells trouble for the game in question because it is only a matter of time before a version of it appears which has absolutely no protection whatsoever.

When this happens, all the man-years of coding and development time which went into the game is wasted, and the company in question starts to lose sales.

We spoke to an anonymous member of the pirate community - he baulked a little at the term "thief", but then the truth hurts, doesn't it? This man is a

self-confessed "cracker" of over 200 commercial games.

We asked him how, if at all possible, he justified his activities, and his answers go some way towards explaining the mentality of the people who plague the leisure software industry.

We'll call him Cutpurse, because he was a little shy when asked his real name, and, well, he sounded like he should be called Cutpurse:

When did you "crack" your first game, and what made you attempt it?

"I was about 14 (Cutpurse is now 19) and right with Pokes and stuff to find out the cheats, so I got into changing the game code after a while."

And was this on an Amiga?

"No, I used to have a 64, but I bought an Amiga 500 three years ago. The early games were dead easy."

How'd you mean, "dead easy"?

"They were hardly protected at all."

And have they become not so "dead easy" over the last three years?

"Yeah, some are a real **** to crack, but that's what makes it so much fun."

But did you realise you were breaking the law? (At this point Cutpurse

became a little animated and his replies have had to be edited.)

"Yeah, but I only ever gave copies to my mates. We had a sort of competition to see who could crack a new game the fastest. We never sold them."

Did you circulate these copies?

"You mean, like, pass them around? Yeah. Like I said, we just cracked them, put our handles in them, and sent them to piss off other cracking crews who hadn't busted the game yet."

What do you think became of the cracked copies?

"Dunno. I never play a game once it's been cracked."

What if you found out a professional piracy outfit was using a game, cracked by you, and selling hundreds of them for profit?

"I'd say 'where's my commission?'" Cutpurse laughed heartily at his bon mot, then continued. "Seriously, though, I know there's a few of my cracked games around on bulletin boards and what have you, but what other people do with them is their business."

What if we said you could be prosecuted as a thief? (Cutpurse's reply consisted mostly of unprintable comments.)

Knaves and thieves

Amiga Computing explains why "pirates" is too good a word for them

Only if you follow the writings of the German philosopher Leibnitz, who believed God had created "the best of all possible worlds", could you summon enough optimism to assume that the thieves of this world would allow a profitable opportunity to pass them by. Most of us see things through slightly less rose-tinted spectacles.

In the early 80s, however, and for reasons best known to themselves, the computer press decided to slap the label of "piracy" on the type of theft peculiar to microcomputers - software theft. The label was a throw-back to the days of "pirate" radio stations, such as Radio Caroline, so called because they

were based on ships out at sea, and in a short space of time it became accepted by all.

It is a complete misnomer. Software thieves aren't to be found climbing the rigging with swords in their teeth, or dashing their way through brave and romantic adventures - thus thoroughly deserving their rich booty for having entertained us all so well in the movies. They are simply thieves.

Have you ever, at school or in work, had a real brainwave and found it

impossible not to share it with a friend or colleague, only to find out the next day they've presented it to your teacher or boss and passed it off as their own idea? You have? Then you too have been a victim of intellectual theft.

Imagine for a moment that your living depends on such original ideas and you find yourself in the position of a software author. Imagine again that your mortgage repayments depend on the development and packaging of the fruits of that idea, and you can then put

yourself in the position of almost everyone else in the leisure software industry.

Not a nice feeling, is it? I mean, if you caught someone with his or her hand in your wallet, would you call that person a pirate, or would your exclamation be rather less romantic?

Flip a coin

If we may put on another hat, what about the punters: those whose expenditure on leisure software constitutes the software companies' profits? From their point of view, the piracy issue is less clearly defined.

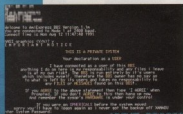

Bombarded from all sides by peer pressures, extremely well considered

Stunt Car Racer complete with cracking crew's message. The disk, supplied anonymously, is an example of how protected games software can turn up in an entirely copyable guise

The piracy inner circle: a London BBS packed with illegal software – years for the taking

The synopsis of this board thinks that this disclaimer is enough to admonish him from the crime of theft

Pirates? String 'em up!

Simon Jeffrey, Electronic Arts

and cunningly pitched advertising, the reviews and recommendations of dozens of computer magazines, and the soaring price of games software, many of our readers may be thinking to themselves "what about us?"

Since the release of Kick Off 2 in 1989, the consumer has watched the average price of a top game soar from £20 to £30 and nudge upwards

towards the £35 mark. In that time we are led to believe that piracy has, if anything, dropped off as the industry fights back through the Federation Against Software Theft (FAST) and the European Leisure Software Publishers' association (ELSPA). Why the discrepancy?

Pay your way

"We live," we were told by ELSPA's Roger Bennett, "in a capitalist society, and a product has to pay for itself." In other words, the software companies have increased the prices of their products to keep up with inflation and the rising costs of developing and market-

ing a successful game. The market economy argument, however, could be couched in another way. If the industry is responding to the push and pull of a supply and demand system, then the very success of professional piracy operations is a clear indication of a ground-

swell of demand for cheaper games. Why shouldn't software houses reduce their prices, thereby reducing the demand for illegal software?

If only life were so simple! There is no doubt an irrefutable aspect to this argument, but in the main it can be combated with another piece of simple capitalist deduction.

No matter how cheap a piece of software becomes, it will always be possible for someone to rip it off and sell it

We do it in real-time ... and in COLOUR.

Faced with thieves who can often produce copies not only of the disks, but credible duplications of the manuals and even the packaging, software companies are in a position where they cannot compete with pirates. In any case, the opinion of many industry pundits is that to try to compete would be

PIRACY

Amiga Computing

At this point, in a perfect world, the Amiga owner will tighten his or her entertainment belt and settle for fewer

The message to prospective pirates could hardly be written in clearer terms.

The budget debate

When challenged, a great many computer users will use the high price of leisure software to justify their jolly Roger software collection. The argument goes that if software publishers want to wipe out piracy, they should remove the stimulus which leads most ordinary users to copy games.

Bringing down the price of new games to £10 or less would, they claim, lead to many more people buying the original games.

While this argument has at first a certain amount of persuasive force, it takes only a little more examination to show just how implausible it is as an explanation for piracy. As Andrew Wright from Virgin Mastertronic told us, "the only way you'll stop games from being pirated is to sell them for less than the price of a disk".

If Virgin Mastertronic, one of the biggest budget software producers, falls prey to a high level of piracy, the argument about piracy being related to high prices loses much of its credibility. "Our re-released titles suffer most", Andrew explained, "especially relatively unprotected stuff like the Infocom games. I've often seen these for offer on bulletin boards".

While it is accurate, then, to say that more people would buy a particular game if it was cheaper, it is clearly not the case that fewer people would pirate it. Professional pirates are in business to rip off the software industry. Lower official prices would simply mean the pirates making slightly less money from their operations.

There's no denying the fact that some software is more expensive than it should be, and that sometimes it seems the copy protection routines receive more development time than the game itself, but high prices are no justification for theft.

Even if it's cheap - people still want cheaper

► games. In the real world, however, this is a difficult exercise.

What of the parent with an Amiga-crazy child who brings home an obviously pirated game, or clamours for some of the dodgy looking but cheap software on offer at some market stalls? The only suggestion we can offer to people in this position is to report the software thief either to ELSPA or to FAST. Cold comfort, perhaps, but the only comfort we can give.

In the end, it is only through action on the part of the responsible Amiga-owning community that piracy will be tamed in our section of the market. Assuming that there will always be a demand for cheaper software, the only realistic way to break the vicious circle of spiralling prices is to cut out the illegal supply side of the market equation.

As more and more pirates are put out of business, the software industry will have to listen to the demands of its consumers and cut prices. Once companies know they can compete again in a market virtually free of illegal and totally unfair competitors, they will have no excuse for continually hiking their prices - and that's when we'll see

The only way to stop people pirating a game is to sell it for less than the price of a disk

Andrew Wright, Virgin Mastertronic

whether they really mean what they say about piracy.

Is it a threat to free competition or a convenient excuse? The only people in a position to force the issue are you, our readers, so get on those phones and shop the thieves to FAST or ELSPA. If you don't, you're only yourselves and the pirates to blame.

The industry speaks

Though FAST, after a series of spectacular successes, have received more attention in recent months, it was ELSPA who first lit the fire that was to become the blazing piracy debate. Their advertisements in the computer press, inviting computer users to "shop" friends or colleagues involved in software theft and offering a reward of £1,000 for information leading to a conviction, brought new life to a tired old argument.

Stirring up controversy, the advertisements were shamelessly provocative, and did as much as anything else to bring piracy to the fore. Some readers found the ads a bit too much but only one, showing a teacher being shopped by his pupils, was withdrawn because it was thought to be too sweeping a brush with which to tar the nation's teachers.

ELSPA "aims at the top half of the [piracy] iceberg," as Roger Bennett, ELSA's chief executive told us. So does ELSPA have no time for small time pirates?

"We receive over 100 calls a week, and they're all stored on answerphone. We will respond to all instances where the caller has hard evidence and leaves a name and address. This information is obviously totally confidential."

Hard evidence?

"Yes. We don't have the resources to follow up what could be a wild goose chase. If we're sent a piece of pirated software with a receipt from the shop or trader who sold it, we can act immediately."

We asked Roger if the level of

piracy has decreased over the past year.

"There has been a drop in piracy - there's no doubt our campaign has had a substantial impact. This time last year a number one hit would be selling to no more than 10 per cent of the user base instead of the 50 per cent or so you might expect. Piracy was to blame for much of the lost sales, but the situation has improved."

So why have game prices continued to soar? We asked him if there was any risk of the software market becoming a sort of "cartel" where game houses set their prices at the level everyone else was settling on. Surely this is as much a factor in the pricing of games as piracy?

"I've often criticised the software industry for being sheep-like," he explained, "and following each other's lead, but I'd refute any cartel view of the industry. It's a competitive market, and if a game is difficult it won't sell. Magazines have a responsibility to point out the dull ones."

Do you think there could be a general drop in prices with your and FAST's successes?

"I see a drop in prices as a probability rather than a possibility, but the residual effects of last year's high levels of piracy are still being felt. It will take time for price cuts to filter through once games start selling to a larger proportion of the user base."

Finally, what of the present situation?

"There are definite signs of improvement, but piracy is still endemic."

Making music on the Amiga

We bring you non-stop arcade madness with the latest all-action Jeff Minter shareware shoot-'em-up!

L with lasers llamas

Long-time computer users, and especially those of us who graduated to the Amiga from the Commodore 64, will remember Llamasoft as possibly the world's freakiest software house. Following a determined path of sheep, llama, and then camel-fixation, Jeff and company produced such classics as *Revenge of the Mutant Camels* and *Sheep in Space*.

After a long silence in the 16-bit market, Llamasoft are back. Amiga owners jealous of their ST-owning buddies – who've been enjoying Llamatron on ST shareware for some months – can now partake of one of software's most fun fetishes.

The game

Llamatron is played on a plain black square in the centre of which appears your llama. On starting each screen, the poor llama is surrounded by aliens

which gradually swarm towards it, killing the beast on contact.

The time-honoured objective, therefore, is to blast as many greenies as possible before your inevitable demise, rescuing all the llamas, sheep, goats, and camels on each screen to boost your points total. To accomplish this you are armed with a laser-equipped llama, whose killing power can be augmented by the collection of power-ups.

Gameplay

There are several ways to play Llamatron, any one of which can be chosen by pushing the joystick in a certain direction while at the title screen. Pushing forward and back on the stick toggles between one and two-player mode, and pushing the stick left and right selects Solo, Player Plus Droid, or Team mode.

This is where it gets complicated! In all playing modes, the llama fires continuously, so there's no need to wear down your thumb or use auto-fire. In standard one and two-player modes,

Even with a droid to help, you'll find some screens a bit frantic

the camel fires in the direction of movement, but as this necessitates moving towards your target, thus endangering your life, there are a few tricks available to spray death and destruction wherever you like.

Those of you with four arms or a couple of joysticks firmly anchored to the desk, can press fire on the second joystick to play the game in a wacky

mode that simulates the way many arcade games play. Using this mode, joystick one controls the direction of movement, and joystick two directs the laser.

In Player Plus Droid mode, your llama is accompanied by a purple blob which runs around doing all the violent stuff, leaving the player simply to avoid contact with the nasties. This mode is

Imploder

Author: Albert J. Brouwer

Readers of Amiga Computing and users of the CoverDisk should by now be familiar with Nico Franciosi's file crunching utility, PowerPacker, and the multi-coloured flashing screen or mouse pointer associated with its runtime decrunch routine.

What most people may not be aware of is the large number of alternatives which exist in the cruncher market, not least of which is Imploder. The latest version, Turbo 3.1, is easily as fast as PowerPacker 3.0 Professional (now a commercial product), and in many cases will save more space than its better known rival. In addition, it is more amenable to the absolute Amiga beginner than PowerPacker, and assumes little or no knowledge of the machine.

The one real drawback with Imploder is that it will crunch only executable files (ie, runnable programs), so if you want to crunch, say, a text file you will still have to use PowerPacker.

To run the program, either click on its icon or select it using the ShortCut menu system at the top of your disk's Workbench screen. The program's friendly user interface pops up and from here on in it's plain sailing.

Let's Implode!

To start Imploding, click on the large Start button or select start from the single pull-down menu. The file requester then asks you to select the program you want to crunch. For our purposes, click on the C: directory, then double-click on the Sound program.

Sound is an 8k program used to play back sound samples and is one of the few executable files on the disk we haven't yet crunched to death. Once you've selected the file, Imploder loads it into memory and carries out its initial scan of the program.

The scan is the first step in an intelli-

Imploder has a very friendly front end

gent crunching process designed to take into account the very different programs one might want to crunch on an Amiga. Imploder will adjust its operation to best suit each file, and this flexibility is one of the secrets of its success.

By now you should be looking at Imploder's main crunch options panel. For the moment, ignore everything except the line of buttons marked 0 to

8. This represents the severity of Imploder's crunching, with 8 representing the most efficient, resulting in the smallest files, and 0 the least efficient.

The time taken to accomplish a crunch is obviously greater the higher up the scale you go, so the default value of 5 is a good middle ground. You can splash out and go for 8, but on small files of less than 50k the improve-

recommended for beginners until you get the hang of the way the game plays as it represents the best helping hand you'll ever get in Llamatron.

Team mode is possibly the most fun, as it enables a second player to join in

with a camel. The two players share common bonuses, a common points, and a common fate, so you'll find it easier to get a higher score, but will no doubt enjoy the potential for raging arguments when your chum gets fried and loses both of you a life.

The last, and ultimately the most important, technique is what Jeff calls "locking". This is done by pressing the firing button and holding it down, and locks the direction of fire in whatever direction you were firing when the button was first pressed.

As you progress, you will find this technique indispensable, as it is the only way of shooting at a greenie without also moving towards it. It is a difficult tactic to master, but with a bit of practice you'll soon be locking in and out and switching between directions of fire very quickly. If not, you'll be dead...

Power-ups

Where do I start? There are so many different bonuses to collect in this game that to list them all here would be useless. Instead, I'll go through some of the most useful power-ups which no

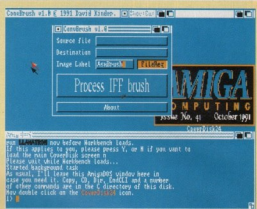

ment is often negligible. Click on Proceed to start crunching, and the first thing you'll notice is the light show on the right-hand side of the screen.

This is just a graphic equalizer-style representation of what's going on when the file is crunched, and the second column is the one to watch. You'll see the column shrink from 100 per cent down to almost 50 per cent as Sound is thoroughly squished.

Tense and exciting

For a more exact measure of the crunch, watch the percentage running total between the Start and Abort buttons.

Maybe it's just me, but I find this a curiously tense and exciting wait! Perhaps the knowledge that if it's not quite small enough it won't fit on the already bulging CoverDisk is what makes crunching so stressful.

Superb programmer's tool which converts IFF brushes to assembly source code.

ConvBrush

Author: David Kinder

A utility of use only to programmers, ConvBrush is a handy tool for converting any DPaint IFF brush to Assembler source code for use in your own programs. It is designed to work in a friendly, intuition-based fashion, but Workbench-hating CLI fanatics can launch it from there by typing

ConvBrush <RET>

If you don't use Assembler, you won't be using ConvBrush, and if you do use Assembler, you won't need telling how to use ConvBrush. Basically, it does what it does, and does it well, so if you get some mileage out of the program, send a shareware donation to: David Kinder, 28 Langholm Road, Garswood, Ashton-in-Makersfield, Lancs WN4 0SG

ambitious player can afford to miss.

The ubiquitous smart bomb is present in the shape of a large smirking tomato which drifts towards the llama and explodes on contact, killing all greenies onscreen - though not the llama. On the first few levels it's best to avoid the smart bomb, because premature destruction of a level can often mean you don't rescue all the sheep

and so on. On later levels, you'll find yourself screaming out for a nice juicy tomato and tearing at it like a bat out of hell once it actually appears.

The next most useful power-ups are those which affect the way your laser fires

How to use The Disk

First of all, you must make a back-up copy of the coverdisk. To do this, boot up with your copy of Workbench, then double click on the Workbench disk icon, followed by the Shell or CLI icon. Now type:

DISKCOPY FROM DFD: TO DFD:

or, if you have an extra disk drive, put a blank, formatted disk in DFI: and type:

DISKCOPY FROM DFD: TO DFI:

Follow the onscreen prompts until the copying procedure has ended, then put your original disk away in a safe place. Now switch off the machine and wait for 30 seconds before re-booting with the copy. Wait until the CoverDisk17 icon appears, double click on it and away you go.

That's all you need to do to make a straight copy of the entire disk. However, you may also want to copy individual

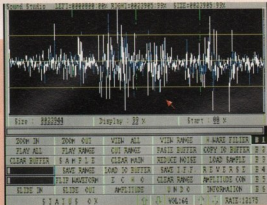

programs from your copy of the coverdisk to a separate disk. In this case ensure that you fully understand which related files need to go with it.

For example, all of the document files on the disk require that the text editor PPhore is in the current disk's C: directory. Therefore, if you copy the docs to a new disk you will also have to copy PPhore to the new C: directory before you can read them.

Some of the smaller docs will not have been crunched, so for these you need only change the tool types on the icon's info screen to reflect whichever text editor you do have on the new disk.

As a general rule, you should carefully read the documentation for any program you copy from disk to disk.

This can save a great deal of messing about and can help you avoid all those infuriating error messages!

SoundStudio complete with Bogey sample

SoundStudio

Author: Craig Eales

SoundStudio is an excellent utility for creating and editing sound samples for use in MED, SoundTracker, or NoiseTracker clones, or for just messing around with. It deals only with mono samples as these, besides being much more memory-conscious, are best suited for use with such sequencers.

The program is feature-packed but easy to use, and will be graphically

quite familiar to anyone who's used sampling software before. There are no pull-down menus, all functions being carried out through a series of buttons on the control panel in the bottom half of the screen, and the program is exited using the Esc key.

If you're already a confirmed sampler, your best bet would be to mess about with the program and refer occa-

sionally to the on-disk documentation when puzzled. Alternatively, by clicking on the Information button in the lower right hand corner of the control panel, you can bring up a quick reference guide to the various buttons and key presses which control the program's functions. If you don't already have a sampler, or if you're new to the game, I'll run through a sample editing/ession to give you the general idea. Once you grasp the basics, everything else is down to experimentation.

Beginner's guide

You might be thinking: why don't I just use the sampling software that came with my sampler? The answer is that SoundStudio is a smaller program than many commercial sampling programs, uses less memory than some, and is a lot simpler in operation than most. Now on with the show!

First you must load a sample from the two we've supplied on the disk. Click on the Load Sample button to bring up SoundStudio's custom file requester, then click on the up/down arrows on the right of the screen until you see the Utilities directory.

Click on this, then on the

SoundStudio directory, which will then allow you to click on the sample of your choice. For now, select the sample called Bogey and it will load automatically. Please note that to use the Load Sample button, you must have a disk in your internal drive.

You now have a snippet from the film Casablanca in your Amiga's memory. For all you film buffs, it's from the bit when the immortal Bogart watches Peter Lorre being arrested without intervening, despite the latter's desperate appeals. When challenged on this, he replies: "I stick my neck out for nobody". A classic moment from a classic movie.

Safety first

A good principle to follow when editing samples is to keep a copy of the original safely tucked away somewhere, so click on the B6 button in the lower right-hand corner to activate buffer number six. Now click on Copy To Buffer.

Just to prove the buffer contents are actually there, click on Clear Main, then on Paste Buffer. The screen will clear, then the original sample will be refreshed from memory. Simple, eh?

For most editing functions, the user

There is one enable three-way firing, whose lifesaving properties cannot be underestimated,

and one which makes your shots bounce off the walls instead of simply disappearing into them.

The latter is particularly deadly if you are forced to retreat into a corner, as by firing into it you can create a lethal crossfire of rebounding shots, especially if you also have three-way shots at the same time.

All in all, the most apt comment one

can make about Llamatron is that Mr Minter makes exceedingly good shoot-'em-ups.

Share and enjoy

Last but not least, Llamatron is a shareware game. This means that if you like it and want to play it some more, and you're an honest person, you'll send £5 to: LLAMASOFT, 49 Mount Pleasant, Tadley, Hants RG26 6BN

In return, you'll receive another Llamasoft game, a brilliant poster of a gun-toting llama, and a Llamasoft newsletter. For five quid it has to be a bargain.

ShortCut

Author: Michael Bradley

ShortCut is a neat little menu utility - only 1.5K! - for adding user-defined menus in Workbench. If you've booted up the CoverDisk already, you'll have noticed that to illustrate its use we've used ShortCut this month instead of MyMenu.

To select a program or doc file from the disk, click in the ShortCut window to activate it, hold down the right mouse button, and make your selection in the same way you'd choose from any Amiga menu. So how does it do it?

If you look in the CoverDisk's S: directory wherein the startup-sequence normally resides, you will find an ASCII text file called shortcut.setup. This is the file ShortCut looks for when it is run from a startup-sequence or the CLI, and contains all the information for the menu which will appear on your Workbench screen.

A shortcut.setup file consists of a number of items separated from each other by hash marks (#), and a list of AmigaDOS commands to be carried out when the item is selected from the menu. The list is terminated with a hash mark and a carriage return and the next item is begun below it.

As an example, if you wanted a shortcut menu item to run your Workbench preferences program without having to go into the preferences drawer and click on the icon, you

would run your text editor (ED will do) and include an item in your shortcut.setup looking something like:

```
Preferences
CD WORKBENCH.3;PREFERENCES/
RUN >ILL: <ILL: PREFERENCES
```

You must use the RUN >ILL: <ILL: construction so that the application multitasks properly, but if you have BRUN or RUNBACK in your C: directory - BRUN is in this month's CoverDisk C: directory - these will do just as well.

The major limitation with ShortCut is that its menu items can't be more than 11 characters long, but you can have as many as 24 items. Even users with utility-packed hard drives should be able to fit everything into 24 slots.

In addition to the menu selection, each ShortCut item has an associated right-Amiga keypress combination. You can therefore launch your application by pressing down the right Amiga key and the correct letter, though if the ShortCut window isn't the currently active window you'll still have to click on it with the mouse to activate it before using the keypress.

As it doesn't use a device-handler, and is only 1.5k in size, ShortCut is very economical on memory, and because its items can have entire scripts attached to them it's as flexible as your AmigaDOS knowledge will allow

This is getting dangerous, moi cher!

Anton Zucharow shows how, with CanDo, you too can be a programmer

Coding with a click

There are thousands of Amiga users around the world who've yearned after the ability to program their machine to do new and exciting things, but who have given up in confusion only a few chapters into a manual on C or Assembler programming. If you are one of those people (and I know I am!), then the answer to your prayers has come in the shape of INOVAtronic's CanDo.

CanDo is an object oriented programming utility, which means it asks you to describe the desired end result, then does most of the coding bit for you. The system works on the principle that a program waits for certain "events" to take place, then reacts accordingly, and the beauty of CanDo is that it makes choosing the events as easy as clicking on a mouse button.

Before you leap into the world of CanDo programming, you'll have to have completed the task of de-archiving the immense amount of material squeezed on to the Test Drive disk from this month's front cover. Don't worry if you've never de-archived something before, as you're not going to do it now! The disk does everything for you - just make sure you have three

The script editor is where CanDo's real power lies

blank formatted disks to hand, boot up the Test Drive disk, and follow the onscreen instructions.

Cards and Decks

A CanDo application is called a deck, and each deck is made up of a number of cards. To build up a deck (or application), therefore, the user adds cards one at a time until the deck is complete.

The deck we'll construct in this tutorial will have one card, containing an animation, sound effects, buttons to click on, and a couple of simple scripts. By the time we finish the tutorial, you should hopefully have gained an insight into CanDo and what it can do, and will be ready to tackle the further examples in

the manual which you should by now have de-archived on to disk.

Boot from the first of the de-archived disks, which should be the CanDo program disk, and wait until the main control panel pops up at the bottom of the screen. This consists of three main parts. On the left is the Status panel with the Browse and Design buttons, then there's the Cards panel, and finally the Objects panel.

The Card

To start a card, click on the icon looking like a stack of cards in the middle of the Cards panel. This will bring up a requester with Card#1 as the default opening card. Click on Edit to edit this card, and when the next requester comes up, clear out the text in the name field and type Chopper as the name of your first card. Now click OK

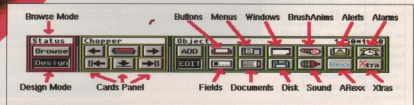

and then Exit to return to the main panel.

Now that we've renamed the card, we have to start putting something in it. Click on the Windows button in the Objects panel (top row, fourth from the left) to bring up the Window editor. We don't want the window to have a title, so just clear the word Unnamed out of the name field.

Next, click on the Dimensions button. This brings up a requester which allows you to set various attributes for the window and choose a picture to go in it, so click under Picture where it says Unnamed. You should now be looking at a file requester which has gone to the default drawer for pictures, the Images drawer on the CanDo disk. Click on Helicopter.PIC then on OK twice to return to the Window editor.

Click on the Objects button. This will present you with a selection of drag bars, close buttons, and so on. Make sure these are all un-selected as we don't want any of them on our Chopper window. Click OK, then on Options, which will bring up a list of options for the way your window opens up. Click on the line saying: The window has visible border, making it change to read: Window's borders are invisible. Now click on OK until you're back at the main control panel.

Helicopter.PIC is simply a medium

resolution blue background on which we're going to play with the helicopter animation, so don't worry if your screen doesn't look too busy at the moment.

The Buttons

To add a button to the window, click on Add, then on the Button icon (top row, second from the left). When the requester comes up, click on OK and CanDo will ask you to place your button onscreen. To do this you click with the left mouse button and drag until the button is where you want it and of the correct size. Click and drag any old place for now, because we'll type in the button's coordinates in a minute.

Once you've placed your button, the Editing a Button screen will appear. First of all, change the button name to Start instead of Button1, then reset the Origin coordinates to 50 horiz and 50 vert. This will be a text button, so find the three Style options in the lower left hand corner and click on Text.

The font/text requester should now appear. Select Embossed from the range of text styles available, and make sure you have the word Start in the text field on the right. You can leave the default font and colour values as they are or mess about with them if you like. The effects of any change will be visible in the window above the requester, so feel free to experiment.

Once you're happy, click on OK to return to the Editing a Button screen, where you should click on Outline. This will avail you of a variety of optional styles for your button, but for now just click on Double, for a double beveled outline, then on OK.

The Script

Now we'll take a look at what gives CanDo its real power – the Script editor and CanDo's built in scripting language. While still at the Editing a Button screen, look at the right-hand side of the screen where you'll find a number of buttons under the word scripts. Click on the Click button (this means your script will be executed as soon as the button is clicked on), and you will be switched off to the script editor.

On the right-hand side of the editor screen, there is a strip of icons you can scroll up or down, each of which represents one of the types of events you can script for. Click on the animbrush object (the red and white checked ball) to summon the BrushAnim Path Editor Tool.

When this appears, click on the button labelled "banim", and when the file requester asks you to choose your BrushAnim, click on Helicopter1.banim, then on OK.

Now you have to tell the script what path you'd like the animation to follow on screen, so click on Record. The Path editor will pop out of sight and your

cursor will appear with a rectangle around it. The rectangle represents the physical space taken up by the BrushAnim, and to record a path for it all you need do is click on the left mouse button where you want it to start, hold it down, and drag the mouse to where you'd like the BrushAnim to stop. Press ESC to exit the record function.

There should now be a visible path line on your screen showing the path your helicopter will take when the Start button is clicked. Now click on three successive OKs to get you back to the main control panel. Note the complex script CanDo has written for you by interpreting your mouse movements as a series of commands. This is one of the most beginner-friendly features of CanDo.

Once at the main panel, hold down the right mouse button and select Save As from the Decks menu. Normally, you'd save your CanDo deck at each significant stage, but you'll not be able to do this with the Test Drive version as the Save function has been disabled. Buy the full program from Checkmate Digital if you want to save things! You won't regret it!

To test your deck, click on the Browse button, then on the Start button on your recently constructed card. The helicopter should appear and follow the path you traced out for it. At this point, sit back and consider how long it would have taken you to produce the same result using C or Assembler!

Now to add some sounds. The first sound button will be a text button just like the others. Click on Add and then

the button icon, then position the button as before by clicking and dragging with the mouse to bring up the Editing a Button screen. Call the Button Sound and change the origin coordinates to wherever you like it best – the button moves onscreen as you press Return so you can mess about until you're satisfied.

Now click on Text. At the text/font requester label it as Boing!, use the Embossed style once more and click on OK. Now click on Click under scripts and prepare to add some sound.

At the Script editor, which will appear when you click on the Click button, scroll down the list of icons on the right hand side of the screen, then click on the single speaker. This is the icon for sound samples and will activate a requester called Play Sound. You should select Set File Name from this, and choose the boing.snd file from the CanDo disk's Sounds drawer.

If you click on OK twice, the Script editor should be displaying the complete sound command, demonstrating once again the usefulness of its automatic scripting facility. Click on OK again to exit the Script editor, then return to the main control panel. A quick browse now should reward you with a silly sound that sounds like a rabbit in mid jump!

Chopper sound

As Boing sounds very little like a helicopter, we'll now add an appropriate sound to the chopper animation. While at the main control panel, click on the BrushAnim objects icon in the object panel (top row, third from the right),

which will activate the BrushAnim Object editor.

Click on BrushAnim name where it says Unnamed, and when the file requester comes up, choose Helicopter1.banim and click OK. Click next on the button which says On Every Frame. This tells the Object editor to carry out the specified event on every frame of the animation.

When the Script editor appears, click on the Single Speaker icon, select Set File Name and choose chopper.snd. Now click OK until back at the BrushAnim Object editor. Now we want to stop the whole animation, including sound, once it reaches the end of its flight path.

Click on At Destination, and when the Script editor appears, type in the following script:

```
BrushAnim
"cards-brushanim/helicopter1.banim"
Audio on
Audio off
Quit
```

Now click on OK twice, then Exit to return to the main panel. You should now be able to click Browse, watch your helicopter fly around the screen, complete with engine noise, then come to a halt with the sound off.

For the moment, in the space available for this tutorial, that's about all we can cover, but you'll find a wealth of extra helpful hints and tutorials on the manual disk – the third disk you de-archived.

There are numerous sample decks for you to play about with, so you can browse through many more examples of the sort of applications you can write with CanDo. Some of them explore the more advanced script commands, for which you will have to buy the full version, complete with full manual to use properly.

The deck we have constructed here merely ripplies the surface of an ocean of potential uses which CanDo could be applied, and if you've been at it impressed by the ease with which you can create your own programs with CanDo, I'd recommend you immediately purchase the full version! STEP INTO THE FUTURE WITH THE AMIGA FAMILY OF COMPUTERS

AMIGA 500

The ideal first time buy, with superb graphics, there is no better machine on the market with 1000's of Top Software titles from as little as £5.00 at Diamond.

AMIGA 1500/2000 rev B

For the more adventurous user, this machine not only offers all that the above does but also has capabilities for the latest in video titling and digitising, high quality animations, most general application software and has the possibility of being easily converted to a compatible PC, XT or AT. Most small to medium sized companies can be easily administered on this machine. NOTE - All of Diamond's press advertising is produced on an Amiga 1500.

AMIGA 3000

The Ultimate machine for the serious user, again as well as offering everything from the other two machines it also runs Commodore's new multi-tasking operating system Workbench 2.0, flicker free graphics on-screen as standard. There is even a Unix option for this machine. It runs at 25MHz on a 32bit processor and undoubtedly sets the standard for professional use for the 1990's

Now You Understand The Machines,
Improve Your Social Standing
With The Ultimate In Amiga Power

DON'T YOU OWE IT TO YOURSELF TO DRIVE THE BEST? NOW YOU CAN WITH DIAMOND PX!

Full upgrade paths and trade-ins are available on your Amiga 500 from all our branches.

All you have to do is bring in your computer and any accessories and as long as it is in adequate condition then you can walk away with an Amiga 1500 for only

£499.00

P/X is available from all of our branches.

Come to DIAMOND and meet the Amiga Experts!

Back in the dim and distant past, two men made a proposition that changed the face of modern music. In 1981, Dave Smith and Chet Wood lit the fuse for the Midi explosion by proposing an industry standard which would enable the sounds of any instrument to be accessed from another.

After some heated discussion and the invaluable input of the Japanese, Midi was finally born in 1982. Once the die was cast the standard became universal and within 10 short years has successfully colonised almost every commercial studio on the planet.

By 1983, the first Midi-compatible synthesizers appeared and the race was on within the software world to support the new musical revolution. The first attempts at sequencing were somewhat less than subtle but nevertheless offered the essentials, such as unlimited overdubs and, of course, the ability to tweak, tidy or completely reorganise a track after it's been recorded into the sequencer.

These functions are at the very soul of sequencing and by definition lie completely beyond the limited talents of tape. Of course, along with increased editorial control, digital recordings never degrade no matter how many changes and attempts are required to produce the finished masterpiece.

In the eyes of many an old muso this technological disease has destroyed the sacred art of putting a swirling line of sound on to a plastic disk. But Midi has opened the floodgates for thousands of

Midi has opened the floodgates for thousands of talented musicians

talented musicians who would otherwise never have carved their name into vinyl due to either a lack of opportunity, practice or tuition on the instruments of their choice.

This broadening of horizons has not only opened music up to the untrained, but for those musos who are willing to embrace the new technology the power of the computer has revolutionised the creative process.

Now an entire orchestra waits at the fingertips of composers and finished scores pour from printers at a single keystroke. Midi has the ability to experiment, cut, paste and transpose in seconds, and without the massive expense of countless re-takes and the extortionate amounts asked for studio time.

Thanks to Midi, modern recordings

DAT's the way to get perfect sound!

are being produced for a fraction of the price of tape-based system and due to the "suck it and see" approach which Midi allows, professionals and amateurs alike are producing work they never imagined possible. And all is achieved from the comfort of their own homes, visiting the studio is only necessary to add the finishing touches and lay down the final cut.

Clearing the air

Now, if you're a old Midi hand you'll be waiting for the usual acronym rundown with the inevitable meaning of Midi – which, of course, stands for the Musically Informed can be Desperately Irritating, as opposed to the all too often quoted alternative which other mags would have you believe.

This tendency for techno-speak rather than explanation is usually enough to put many off experimenting with Midi before they've programmed a note. In fact, Midi is by no means as complex as a lot of techno-junkies would have you believe, and to combat the acronym attack a brief explanation of some of the very basic principles is in order.

Get in sequence

The range of sequencing alternatives on the Amiga is increasing by the day, but at the moment the now world famous MusicX and Gadgets Sequencer One are the two to be beaten.

Both packages handle all the essentials and a good deal more besides, with MusicX being the more complex of the two and Sequencer the choice for those primarily interested in ease of use. Both packages are excellent but a little hands-on experience thanks to a

friendly retailer would be a good idea before you make your decision.

MusicX might be the choice for the money conscious musos because there are a few good deals available if you fancy digging through the classifieds.

Having said that, there is some doubt about Micro Illusions' willingness to support the product as far as upgrades are concerned.

If you're looking towards studio work, either of the two packages would be ideal, and even if the studio you choose uses one while you've opted for the other, exchanging files between the two is simple so there shouldn't be any real problems. And of course, there's nothing to stop you dragging your own system in with you if necessary.

A note on keyboards

Keyboard selection is tricky because two opinions of the same hardware can differ considerably depending on taste, but as far as Midi's concerned the only real consideration is the available ports – which obviously must have IN, OUT and THRU. The THRU may not be available on ageing second-hand gear but it can be invaluable if you're planning to expand your system later.

A secondary but still huge consideration when investing in any keyboard is the availability of patch editing software. In the first few weeks of ownership this may seem unimportant, but it becomes useful when you're looking for

The Amiga has long been waiting in the musical wings. Paul Austin explains how you and your machine can take centre stage

The Amiga comes of age

The next step up from a standard MIDI setup is to record direct to hard disk. As little as two years ago this type of system was strictly for the pros, but thanks to Sunrise Industries of California such power may soon be in the hands of mere mortals like you and me.

Given a suitably well-endowed hard drive, an entire song can be treated just like a normal sample and complete sections can be cut, pasted, looped and combined as required.

The benefits of direct to digital recording are incredible, not only for the powerful editing options but also for the range of sound that can be captured. Due to the dynamic limitations of tape there will always be a certain amount of fidelity lost, but with a pure digital signal the entire dynamic range of the sound is captured and superb definition is added to the sound.

new sounds without incurring the expense of a new synth.

If you're on a limited budget, patch editing comes second only to sequencing. Put simply, it allows you to import the sounds from your synth or module into the computer for editing. This process is referred to as a fetch, and once fetched the formerly unobtainable sound appears onscreen as a series of waveforms and variables which are very easy to relate to, and which make com-

plex changes as simple as dragging a point on a wave or selecting an option from an icon.

These miraculous little utilities allow you to redesign your sounds completely, all the way from simply altering the waveform right through to the type of reverb or the length of delay, in fact, any parameter relating to the sound. If that's still not enough, individual sounds can be blended or totally new ones created from scratch.

When your masterpiece is complete, either individual or entire banks of sounds can be saved to disk or dumped back into your synth in the locations of your choice. They will remain there until the next update, stored permanently just like the originals.

A word of warning: always back up before you start to tinker, it can save a lot of tears later.

Modular expansion

On the surface, modular expansion seems the ideal answer to the ever-increasing spiral of expenditure that modular addition tends to inspire, with modules often saving hundreds as opposed to the keyboard alternatives. But it's still much easier to sell a complete keyboard than a module, so if you're the sort of person who has to keep up with the neighbours, complete keyboards may be a better bet, purely from a resale point of view.

Multi-timbral means simply that several instruments can be played at any one time. Most modern units play up to eight separate synth voices simultaneously in addition to a complete drum

Here's a brief glance at some of the huge variety in the Multitrack market, from the tiny X-28 right through to some very serious eight track systems

condensed into a single lightweight unit that produces the illusion of an entire band, thanks to a few blips of data from a sequencer. Isn't technology wonderful? It is, unless you're an ex-session musician, of course.

For the beginner, multi-timbral units such as Roland's CM-32L and the older MT-32 are ideal. The sound quality doesn't match that of dedicated units such as Korg's M1 and others, but they're still a great place to start. Even with their restrictions on quality they can still match the performance of those infinitely more expensive units which were producing classic hits only a couple of years back.

OK, once you've chosen your sequencer, modules, keyboards or both, the next step is to connect it all up. With the Amiga this means stuffing a MIDI box costing as little as £20 into the serial port, adding a few MIDI cables and a MIDI OUT from the source to the MIDI IN on the box and you're off. If, however, you're looking to build a system that uses multiple sources, a MIDI junction box is a good investment.

With most units offering MIDI THRU it might seem a waste to invest in what is merely a signal splitter, but daisy-chaining three or four units together via the THRU ports can cause problems.

Each time the MIDI information is passed THRU a unit a little of the initial quality is lost and as a result the signal can become dirty. The obvious result is that some data may become corrupt when it's passed on to the next unit in the line.

Because a MIDI cable is basically a serial link which passes data in succession between units down the line, long cables mean increased transfer time. As a result, those at the end of a lengthy cable and THRU port connection may not receive their data fast and clean

The range of sequencing alternatives on the Amiga is increasing by the day

enough to keep up, and information can become scrambled.

A junction box simply gives a copy of the complete MIDI signal direct from the sequencer to each sound source. There are no lengthy cables between the Amiga and the target and, of course, no THRU ports, so all your MIDI information is delivered squeaky clean and at optimum speed.

The right track

Now, assuming you have a hi-fi or amplifier you should now have your latest creation blaring from the speakers in all its pure digital glory. Unfortunately for most of us, once the sequencing is complete it's time to compromise our digital principles and add some analogue, whether that be vocals, guitars or, in fact, anything that requires a mic before it can be captured.

If you're a digital purist it's possible to bypass the problem by sampling and triggering the captured sound from the sequencer. This is fine for the occasional "Too baby, get down momma", but if you're after a complete acoustic guitar track you'll need an entire hard disk sampling system to do it.

As you can see from some of the ▶

MIDI

The Amiga has long been waiting in the musical wings. Paul Austin explains how you and your machine can take centre stage

track arranged from a variety of drum sounds - and all that is packed into a tiny box best described as musical tardis. It's not all beer and skittles though, as there's a limit to the number of individual notes or partials that can be played together.

With most multi-timbral units the available number of partials is about 32, which means that up to eight separate voices can be playing in concert as long as the total number of individual notes doesn't exceed 32. Did I say MIDI wasn't confusing?

This band-in-a-box effect is due to the power of MIDI. The huge mountains of hardware once associated with the average keyboard player have been

► photographs there are plenty of multi-track studios on the market, but if you're a Midi enthusiast make sure you go for a unit with built-in Midi sync, or at least one which can support an external sync unit. This is vital if you're going for really big productions as it allows you to sync your sequencer to music already present on the track.

This musical miracle occurs thanks to a Midi Time Code or MTC which is recorded directly on to the tape. MTC is a descendant of SMPTE/EBU time code – this being the industry standard in the TV and the film business since Adam was a lad.

Once it's recorded on to a track, MTC can be read by the sequencer on playback or record. The sequencer can then adjust its Midi information accordingly, sending perfectly synchronised data to the various keyboards and modules as required.

The Mix-down

After you've built your system and written a classic, the final task is to mix down your masterpiece and create the next number one. Again, Midi can play a large part in the process, especially if you're working with a professional,

Special thanks to A1 Music Manchester and Spirit Studios for their invaluable assistance and especially to Max Lindsay-Johnson of A1 for his essential technical support.

Midi-friendly mixing desk which can, in some cases, be preprogrammed to punch in, fade out and mute tracks automatically as the mix takes place.

In the bad old days "mix down" meant all hands to the console as various tracks were added and subtracted from the overall sound. This process almost inevitably led to the odd disaster and a tendency for individuals to add a little too much of what they liked and perhaps a little less of what they didn't.

For most of us using home studio

equipment the need for countless fingers on the faders isn't really a problem, but there's still the question of where to store your masterpiece and how to keep it at its best after the 400th demo has been dispatched to the ever-eager record companies.

In the past this meant occasional remixing of masters or running a few copies off at one time, all with the hiss that only analogue can add to the sound. Fortunately, an answer has

arrived for the semi professional who wants to maintain sound quality.

DAT, or Digital Audio Tape if you prefer, is the answer to many a muso's prayer, giving a crystal clear signal and no degradation no matter how many copies are made from the original.

The DAT player in the article is a perfect example of what's on offer. Retailing at around £500, it's ideal for the serious enthusiast.

Fancy this in your back bedroom?

Midi music lessons

As simple as sound recording and especially Midi may appear on paper it can be a confusing area, and to beat the technology blues Manchester's School of Sound Recording, or Spirit, offer a whole range of courses aimed to make any musician's first tentative steps a little easier.

Spirit offer three short five and three-day courses aimed at complete beginners as well as the more advanced. The first course gives a basic grounding in the studio and covers the basics of recording and working in a studio environment. It isn't aimed at Midi but rather at getting your talents on to tape.

The second course is a direct follow-up to the first and goes much deeper into signal processing and mixing. It also makes a start on Midi with an introduction to SMPTE time code, sampling, triggering and principles of Midi. If you can class yourself as a well versed amateur this could be the one for you.

The final part of the trilogy is the Sampling CMI Programming and Midi Workshops. This course runs over a weekend and covers the more advanced aspects of Midi, including

the theory on sequencers, drum machines and a more in-depth look at sampling.

Time code and synchronisation are explained in more detail and there is a look at Midi-controlled effects and recent advancements in the field, such as Midi mixers, programmable patch bays and pitch to Midi converters.

The above vary in price from £172.50 to £230.00inc. If a week's tuition isn't enough Spirit also hold a 48-week course that can be taken either during the day or in the evening. As you might expect, this goes into great detail and is designed for those looking for a career in engineering.

Registration will set you back £50, with £30 to follow for each week of the course. All of Spirit's courses provide a certificate and, hopefully, a step in the right direction for you and your music.

Spirit also have a working studio and most courses allow the students a certain amount of studio time in which to produce either their own work or that of a band.

If you're interested in signing up you can contact Spirit for further details on: 061 228 1830.

Jason Holborn looks at the state of the art in Amiga sampling technology and offers a few tips on getting the most from it

Sample city!

You don't need me to tell you what a great machine the Amiga is for playing around with music. Whether you're composing your first chart hit in Music-X or just tinkering around with Quartet, the Amiga's musical talents are more than obvious.

But you don't need to be the next Jean Michel Jarre to play around with the sound capabilities of your Amiga. Using a nifty little gadget called a sound sampler you can literally grab sounds into your Amiga from your favourite records, or even from real life, and play around with them to your heart's content.

A sampler converts sounds from the real world – analogue sounds – into a format that the computer can understand. And as we all know, this can mean only one thing – numbers, lots of them. These numbers can then be played back by the Amiga's powerful sound chip, Paula.

OK, so far we have what amounts to a rather expensive tape recorder, but the Amiga can do a lot more than this.

Using a sample editing program, you can manipulate the sound in any number of ways, ranging from simple operations such as cutting, copying and pasting sections of sample, to the real fun stuff like adding echoes and looping. Don't worry if all this techno-talk confuses you, we'll be explaining the jargon later on.

But why buy a sampler? The answer is simple – they're a lot of fun. There's something uniquely perverse about being able to sample someone's voice

and then play around with it. If you've ever wanted to put words into your best friend's mouth or play burping sounds on your MIDI keyboard, a sampler is the thing for you.

Samplers aren't only good for making your Auntie Mavis sound like a space alien who's been on the helium, though. If you're feeling a little musical, you can use your sampler to grab instruments from prerecorded music or from real life.

Getting serious

In this way you can build up a huge library of sampled instruments without ever having to pay the high cost of buying the equipment yourself. With professional instruments costing many thousands of pounds these days, sampling is a considerably better bet.

I've annoyed quite a few people by sampling instruments for which they've had to pay hard cash. Despite the fact that I only own a single synthesiser (a Korg M1), my sample library consists of sounds from a vast range of professional kit including the D50, the SY77 and even the infamous Fairlight.

Once samples are laid down on to tape, you can hardly tell the difference between a sample and the real thing. What follows is a roundup of the best samplers currently available on the Amiga.

We've deliberately restricted it to 8-bit samplers, but both 12 and 16-bit units are also available. We'll bring you more on these later.

Sampler talk

Are you totally flummoxed by sampling jargon? I'm not surprised if you are. With our guide to sampling jargon, however, you too can bore people stiff with seriously technical words.

KHz The sampling frequency is measured in KiloHertz (KHz). This value denotes how many times per second the sampler analyses the incoming audio signal (x 1000).

ADC Analogue to Digital Converter. This is the heart of the sampler. Its job is to convert an analogue audio signal, such as from a hi-fi, microphone or CD player etc, into a series of numbers which the computer can understand.

DAC Digital to Analogue Converter. As you can probably guess, this is the opposite of an ADC circuit. A DAC converts digital sample data held in the memory of your computer into an analogue signal which is passed through to the audio jacks built-in at the back of your Amiga.

LOOPING Looping is a process whereby a short burst of sound is played continuously to give the illusion of a much larger sample. Loops can be used with anything from a simple tone to a drum pattern.

MasterSound

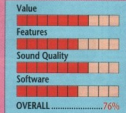

£39.95 • Microdeal

MicroDeal were one of the first companies to produce a truly budget-priced sampler in the shape of their excellent Master Sound. It's fairly basic, but Master Sound certainly delivers the goods. If you're after a cheap, no frills sampler that produces decent samples, MasterSound is a good bet.

The MasterSound package consists of a spartan cream-coloured sampling cartridge graced with just a single connector. There's no sound level controls, no printer passthru, no nothing – just a single jack connector which is used to feed in the audio signal. As a result, MasterSound doesn't support stereo sampling, although this isn't really much of a loss.

The bundled sampling software is pretty, but is lacking in real editing power. Most of the basic functions are there, but

AudioMaster 3 it most certainly isn't. One nice feature is its built-in sample sequencer which allows you to produce very simple tunes using your samples. The overall sound quality of Master Sound is very good from within its own software, but it did tend to degrade when used with AudioMaster 3. On the whole though, samples were clean and crisp.

Master Sound

TechnoSound Turbo

£34.99 • New Dimensions • Tel: 0291 690933

Introduced to compete with MicroDeal's Master Sound, New Dimensions' TechnoSound is a real killer of a sampler. Packed with powerful, and some genuinely fun, features it's a sampler to be reckoned with. Now that it's been upgraded – hence the extra Turbo bit in the name – is there no stopping TechnoSound?

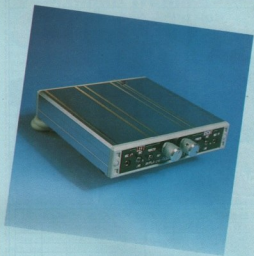

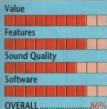

The TechnoSound hardware looks very similar to Perfect Sound. Not only does it share the same colour – black – but it has the same two connectors living at its rear.

Like Perfect Sound, it too can sample in full stereo. Unfortunately, the build quality of TechnoSound didn't seem too hot, but then I suppose you must expect some concessions when a sampler that is as capable as TechnoSound is sold at such a low price.

The TechnoSound software is pretty impressive. It has all the usual editing features you'd expect, but what makes it so good is its fun features.

Its built-in special effects allow an incoming sound signal to be processed in real-time – just like a professional effects unit, really. These effects include the usual echo and reverb, but the fun starts when you play with Extremator and Legless.

The sound quality of TechnoSound is surprisingly good, but it occasionally produced samples which were a bit muffled. I wouldn't hold this against it though – if you did, you might just be missing out on a real bargain. On the whole, if money is a little tight, you won't go far wrong with TechnoSound.

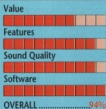

Audio Engineer

£199 • HB Marketing • Tel: 0753 686000

If you're looking for the Rolls Royce of Amiga samplers, look no further than RamScan's Audio Engineer. It's a fairly pricey little number, but you'd be hard pushed to find an Amiga sampler that can touch it.

If you intend to use your Amiga sampler professionally (and many well known musicians do – Paula Abdul, for example) you'd be a fool to look elsewhere.

What you get for your money is a pretty impressive sampler about the size of an average modem. It has a printer pass thru connector built-in so there's no problems there, although you have to switch out the sampler to use this feature.

On the front of the unit is a large array of bits and pieces which include two volume control knobs for the incoming signal and connectors for the sound signal.

As you've probably already guessed, Audio Engineer fully supports stereo sampling. Its twin DACs and quite sophisticated filtering and anti-aliasing circuitry allow for some exceptional samples. I've said it before, but I'll say it again – Audio Engineer produces some of the sharpest and cleanest samples I've ever heard on the Amiga, rivaling some 12 and even 16-bit samplers.

The bundled sampling software is exceptional. Despite the fact that it has Audio Engineer plastered all over it, it's really AudioMaster 3.

As any Amiga sampling aficionado will tell you, there's no better sampling program than AudioMaster.

Perfect Sound 3

£59.99 • HB Marketing • Tel: 0753 686000

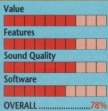

If there's one company that knows a thing or two about Amiga samplers, it must surely be SunRize Industries. They've been working on their Perfect Sound system for more years than I dare to mention, so you'd think that they'd have it right by now. Unfortunately, Perfect Sound is still nothing more than above average, so you may well want to look elsewhere before taking the plunge.

SunRize's sampler is a mysterious black box that – like most samplers – plugs into the parallel port of your Amiga. It too is rather spartan hardware-wise, with nothing more than a couple of connectors at its rear to break the monotony. The overall standard of construction is very high.

Some of you may already have a copy of SunRize's earlier sampling software, since it is now freely available in the public domain. Version 3.0 of the Perfect Sound editor isn't that much different from previous releases, apart from the obvious cosmetic changes. It's a very nice program to look at, but I must admit that it seemed a little tatty in places. Unfortunately, some of its requesters are particularly poor.

The quality of samples grabbed with Perfect Sound is pretty good, but a high-frequency audible hum was introduced to some samples. It's not that easy to spot, but anyone with a trained ear will point it out straight away.

Despite this quibble though, Perfect Sound is still a very good sampling system.

Getting the most from your sampler

It's very tempting to blame the manufacturer when your sampler doesn't quite produce the perfect sample, but they aren't always to blame. Like it or not, you could be doing something wrong. With our guide to better sampling, you too can produce samples of the crispest quality.

SOUND SOURCES – You may think this is pretty obvious, but it's surprising how many people fall into this trap. The better the quality of your sound source, the better your samples will be. If you're sampling music, a CD source is the best you can get, but a high quality tape player is a good second best.

In the case of sampling real life sounds, a decent microphone is very, very important. Quite a few sampler manufacturers include microphones, but they are always useless – throw them in the bin immediately!

If you can afford it, pop down to your local hi-

tech music equipment stockist and have a chat with the salesman. He'll be able to advise you on which microphone to buy. You may have to pay a fair bit for it, but you'll be amazed at the quality it will give you.

SAMPLING RATES – Everyone knows that the higher the sample rate, the better the sound quality, but there's more to it than this. Many samplers now offer sampling rates of up to 57 KHz, but virtually no music packages support such high rates – 29 KHz is about as high as things get.

If you do want to use samples within packages like Music-X, a good trick is to sample the sound at the highest rate and then use something like AudioMaster's Tune Waveform function to knock the sampling rate down.

This usually results in a much higher quality output than you would have obtained if you had sampled the sound at that rate in the first place.

Sample Studio 2

£69.95 • Datel Electronics • Tel: 0782 744324

Datel's offering to the more serious sampling fanatics is the Pro Sample Studio 2, a bulky but reasonably capable system that builds upon the strengths of Datel's original Sample Studio system.

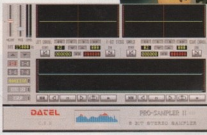

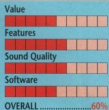

Unlike all the other samplers on test, Datel's unit is the only sampler that doesn't connect to the Amiga's parallel port. Instead, Datel have wired the thing up so that it runs off the expansion port on the left-hand side of the A500.

As a result, it won't work on any machine other than the A500, although an internal version which plugs into the co-processor slot of the 2000 is also available. Datel have also thoughtfully included a passthru connector, so hard disk users are still able to use their drives on the 500.

The bundled software is a respectable enough offering, but it's still not perfect. Once again, it looks pretty, but editing power leaves much to be desired. Unfortunately, because the sampler runs through the

Amiga's expansion bus, you can't use something like AudioMaster 3 instead, so you are stuck with Datel's offering.

For such an expensive sampler, the sound quality of samples certainly doesn't justify the price. Even when sampling from a digital source, the samples were far from faithful. Admittedly, they're better than the Micro Sampler, but not much.

Sample Studio 2

Don't forget also that some sounds don't need to be sampled at high rates. Drums are a prime example.

Most drum sounds can be sampled pretty faithfully at around 10 KHz, although High Hats will need higher rates to capture those higher frequencies. As always though, experimentation is the key.

LEADS – It's all very well having a great sampler and a brilliant sound source, but you'll still get pathetic results, if you use a lousy lead to connect the two. Once again, a good professional sound lead is a must.

Considering their price – around £5 for 3m – you'd be a fool not to splash out. Not only that, but they usually come with pretty decent connectors, therefore ensuring that interference introduced to the audio signal is kept to a minimum.

Sound Master

£129.95 • HB Marketing • Tel: 0753 686000

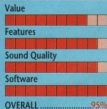

If you'd like a sampler that can give Audio Engineer a run for its money, then Agis' Sound Master could be what you're looking for. Not only does it include the award-winning AudioMaster 3 sample editing software, but it produces samples that are definitely on a par with its main rival. Once again it isn't cheap, but you get what you pay for.

Like most samplers, Sound Master connects to the parallel port of the Amiga, but Agis have very kindly connected a metre-long cable to the sampling hardware which means that you can bring the sampler around next to your keyboard.

This is a necessity, because the unit includes both a sliding level control and even a built-in microphone – something that even Audio Engineer doesn't have!

As mentioned previously, the software bundled is none other than Audio Master 3, which is actually exactly the same program that comes with Audio Engineer. As a result, there's very little to separate the two samplers apart from the obvious price difference.

The Audio Engineer hardware has a few more features, such as a printer passthru, and is generally of higher build quality, but the two units perform almost identically.

AMAS

£99 • MicroDeal •
Tel: 0726 68020

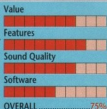

MicroDeal's "professional" sampler is quite unique in that it is the only Amiga sampler that also comes complete with a Midi interface. As a result, you can kill two birds with one stone. A shrewd move from MicroDeal, I'm sure you'll agree.

Unfortunately, AMAS really is starting to show its age. It's been available for a couple of years now, in which time it's sold very nicely thank you. But it has now been surpassed by much cheaper systems.

The sound quality isn't bad, but it's hardly going to give Audio Engineer a run for its money. Don't get me wrong, AMAS can still produce some very acceptable samples.

What really lets it down is the sampling software. It's restricted to producing samples no greater than 200k in size, arranged into a maximum of eight banks. Not only that, but the maximum sampling rate is only 28KHz.

Now you can see why AMAS has aged so much! But then again, if it's good enough for Paula Abdul – she uses one extensively – it should be good enough for anyone.

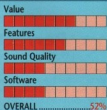

Micro Sampler

£24.99 • Datel Electronics • Tel: 0782 744324

OK, it's very cheap, but Datel's Micro Sampler is hardly going to win any prizes for sound quality. It's a very simple no-frills mono sampler that is about the size of a king-size cigarette packet. If you're totally and utterly skint, you may want to give it a whirl, but personally I'd prefer to save up a few more pennies for something like TechnoSound.

The bundled software is exactly the same as the software which is used to accompany Datel's Pro Sample Studio, which has now ceased production. While it looks very nice, you'll soon come to realise that looks are about the only thing going for it. Editing is quirky and there are too many tools which can only be described as completely useless.

Most of the samplers tested are very closely matched where sound quality is concerned, but the sound quality of the Micro Sampler is awful. Even when used with AudioMaster 3 and Omega Projects' Sound Enhancer, samples came out muffled and very distorted. If you buy this, you only have yourself to blame!

Sound investment

You've probably read previews of Omega Projects' Sound Enhancer in other publications, but we managed to get an exclusive peek at what could be one of the most important audio releases for a long time. The device, which claims to improve the Amiga's sound quality using some sophisticated filters, plugs in between the Amiga sound jacks and your hi-fi or monitor.

The Sound Enhancer improves the sound quality of just about any program, but is especially at home with samplers. Indeed, Omega originally designed the thing to work with their own Sound Trap sampler, but it works equally well with any other. The tiny box contains just two controllers – a proportional control knob which increases or decreases the unit's effect, and a little switch

which turns the box on or off. The increase in sound quality is absolutely astounding. If you thought the Amiga's sound capabilities were pretty good anyway, you're in for a real shock. Even with the worst samples I was able to grab stunning samples.

When used in conjunction with something like Audio Engineer, my samples were of professional quality – bass becomes much punchier, and high frequencies were enhanced beyond belief.

For the £35 asking price, every Amiga owner should own the Sound Enhancer, especially if they also own a sound sampler. Once you've heard the Sound Enhancer for yourself, I can virtually guarantee that you'll want to buy one straight away. I'll be first in the queue!

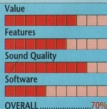

Sound Trap 3

£29.95 (or £54.95 with AudioMaster2) • Omega Projects • Tel: 0925 762885

There's always one product that turns up too late to have its picture taken. As you can probably already guess, Sound Trap is the one. In a way, it's a great shame because it's the only budget sampler that not only offers a printer passthru connector, but is also fully compatible with all Amigas, including the A1000!

Omega do bundle sampling software with Sound Trap, but it's pretty dire – even they admit that. So, being a smart lot, they've bundled it up with Agis' AudioMaster 2 (not 3) sample editing software at a reduced price. When used with AudioMaster 2, Sound Trap produces decent samples. In fact, they're some of the best I've heard from a budget sampler.

The only thing that really lets Sound Trap 3 down is its price. It may seem cheap at first, but you really do need to buy a copy of AudioMaster to get the most from it. This knocks the price up quite a bit, pushing it way above both TechnoSound and MasterSound.

You deserve the best!

Now you can get the best... with PEN PAL!

A superb package, with immense power, to fulfil all your word processing requirements and... it includes a Database! It's all so easy to use, you probably won't need to refer to the extensive 250 page manual too often.

Whilst working, you can open up to four documents simultaneously (memory permitting), search and replace; cut, copy and paste; check your spelling with a 100,000+ word dictionary. You can import your favourite IFF/HAM graphics, from programs such as DPaint II or Clip Art files in various sizes and colours. You can automatically flow text around graphics in any Workbench compatible font (there are over 200 available styles), in different sizes and colours to suit your design... even as you type. All this from a word processor and... Much, Much, More!

As you can see, this is not just any ordinary word processor! Full Page View with position, edit and creation of graphic objects. Mail Merge using the built in database and forms designer. Creation of templates for complex reports, into which the database can be merged.

Operating with 32 fields per record, and 32,000 records per database with a fast sort of 1000 records in less than 5 seconds this is a *real* database.

Pen Pal requires an Amiga 500/1500/2000 or 3000 with a minimum of 1megabyte of available memory.

A robot takes shape

Some of Caligari's sample rendering

It's CAD Jim but not as we know it!

Caligari is what many Americans have been praying for, namely a CAD package that embraces the speed and power essential to a designer while retaining the aesthetics that only ray tracing can create.

In the past the choice was simple – either you went for the stunning but slow process of ray tracing or the speedy if less than stylish approach of the countless 3D Modelling packages.

As you can see from the screen shots, Caligari not only offers design skills to match anything in the modelling world but also the artistic talents to challenge the much slower true ray tracers such as Sculpt, Real 3D and Imagine.

Evaluation Mr Spock

Caligari's primary mission is to provide a perfect representation of your three dimensional designs, so for the amateur it could mean the creation of a dream kitchen long before the first cabinet is cobbled together, or perhaps the design for that desperately needed extension.

The system can work with a predefined grid engineering design and it's even possible to type blueprint information direct for the plan, instantly transforming the confusion of two dimensions to the clarity of three.

Once complete, the image controls allow you to zoom in and

orientate either the world or the object at any angle thanks to the very speedy wireframe mode, only pausing to snapshot a full colour image direct to disk or straight to a printer.

As well as its design talents, Caligari also offers impressive and flexible control over every element within the image, whether that be colour, lighting or material.

Perhaps the most important aspect of the program's flexibility is its handling of the objects themselves. Like many of the leading ray tracers, it employs heretical control. A good example of this would be the engines on Enterprise which were manipulated as one unit, stretching, sizing and orientating in unison, even though they're made up of several individual objects, all of which could still be isolated and edited separately as required.

Because of its artistic as well as engineering talents Caligari is perfect for presentation work, and this especially applies to the Broadcast version which supports a very powerful animation module. This allows the various elements within a scene to be assigned as

actors. These various thespians can then be directed around the scene on predefined paths.

The individual players don't stop there as their component parts can also be assigned as joints. So, for example, a robot could have its arm and hand pivot in a friendly wave as a prospective client glides down the corridor of his or her virtual investment.

This heretical approach to movement also extends to the consumer version which doesn't support animation but still benefits from the option when designing still frames.

Analysis complete

In many ways the Caligari interface is very similar to that of Imagine but with one huge improvement – unlike Imagine, Caligari doesn't require constant saves as you move between the various modules.

The only disk activity occurs as the various modules are loaded. This does slow things up a little on a floppy

system but if you're a hard drive user the time taken

Paul Austin beams down to render a few opinions on Caligari, the latest package in the operating system

is barely noticeable. On the consumer version of the program fitting between modules is restricted to the **Design** and **Scene** modules but on the broadcast version you have the added bonus of the **Anim** option.

For most of us movement will probably be restricted to that offered by the consumer version. As the names suggest the **Design** module is where most of the work takes place with occasional visits to the **Scene** option for lighting and occasional loads, saves and, of course, the vital final render.

The animation on the broadcast version isn't the only difference between the two, as the consumer version also lacks the point editing abilities of its big brother, not to mention the ability to render direct to a frame buffer.

Unfortunately, being without the aforementioned hardware, I can only quote the suppliers description of, "Stunning" in regard to the frame

buffer output, which isn't totally unexpected considering the broadcast version retails at £1,500 as opposed to the £99 for the consumer variant.

The lack of point editing on the consumer version will no doubt cause a few problems as the ability to slice, sweep and select individual points does add a whole new dimension to the editing of the various primitives.

Having said that, the variety of standard prims on both versions should mean the majority of objects can be constructed from individual prims. This combined with the assistance of the Tools menu, which is present on both versions, should make life a little easier if you're struggling with a particularly tricky bit of modelling.

The various tools allow objects to be glued, un-glued, copied and, perhaps most importantly, extruded. Extrusion or, to put it more simply, the ability to hand draw your own objects in two dimensions and then sweep them into the third means that almost any shape is possible, the only real limit being your imagination.

Once your object is complete placement is the next obstacle but thanks to the best mouse driven interface I've yet had the pleasure to use this is simplicity itself. When arranging an object you have the option to either manipulate the viewpoint or the object.

Perfect position

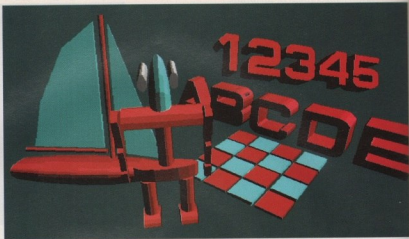

To achieve this the stacking menu system displays the various environmental movement controls which vary the effect of the mouse from working in relation to either the plane of the object or that of the world in which it's placed. Switching between the two allows you to position the view point to perfection.

Once you're happy with your particular view of the scene a single mouse click transfers the mouse movement into that of the object itself. Again, you have the option to move the object relative to its own axis or that of the environment, placing it either by eye or by the user defined grid reference system.

Now you and your object are in the perfect position the next task is to orientate the object itself. This again is done by the trusty rodent. One click on the rotation button and the selected shape spins in any or all of the three dimensions while remaining stationary on the predefined spot.

As you can imagine, controlling a three dimensional spinning object with a strictly two dimensional mouse isn't always an easy task, so one of the axes is assigned to the right button while the remaining two are controlled by the left.

Even when control is split

Complex scenes can be constructed fairly easily

between the two buttons things can still be a little confusing so the program has the invaluable ability to switch off any combination of axes as required. This also applies to the object movement and eye placement controls.

So if you merely want to lower an object into a particular spot it's a simple matter of selecting the axis in question and lowering away, safe in the knowledge that the remaining two dimensions will remain completely static.

Sometimes – and especially when working to engineering standards – the default perspective view isn't always enough. As a result a separate view from each of the three elevations can be accessed. All these views can be individually positioned and zoomed in and out of as required.

Object onscreen

When the three orthographic views are combined with the perspective, placement of the subject can be done to an accuracy of four decimal points and, of course, if your hand and eye co-ordination isn't quite steady enough for such work you can always employ the definable Gridlock option to do it for you.

Assuming you and your masterpiece are in perfect position and you've had a trip to the scene module to adjust the lighting, it's time to render your creation. When rendering an object or

scene for the first time there is a pause of almost ray tracing proportions while the calculations are made for light and the assorted objects, but eventually your masterpiece will appear and it's at this point that you have the added bonus of making the most of the Amiga's colourful talents.

After the render is complete you have the option to either return to the wireframe, save the image or proceed on to the colour control menu which allows you to adjust the colour of individual elements within the image or entire groups.

This section works in the same way to that of heretical options in the wireframe which allows you to cycle through the individual parts within an object and select separate elements for editing. Once the colour editing is complete the scene can be re-rendered in a fraction of the original time and the product saved or printed as required.

In general the manuals are excellent apart from the occasional passage such as the Point Editing section within the broadcast version which is completely dreadful.

This particular section has to be either the product of someone who

assumes you were part of the design team or perhaps more likely it's the ramblings of an author who didn't really know what he was waffling on about. An added bonus to the tuition offered by the manuals is the

Caligari tutorial videos which does a good job of easing you and your ideas into the virtual world with a few examples of just what this extremely powerful program is capable of.

Captain's log

On the down side my only real moans concern the lack of any boolean operations which would allow objects to be used as tools on others, cutting and slicing as required.

My only other concern is the lack of interaction between Caligari and other programs. At present Videopace is the only program which can share its output with Caligari but I'm assured future revisions do plan to embrace other packages.

As you can tell from my commentary, I'm impressed, and if you're looking for a way to combine the graphic talents of your Amiga with the power of an excellent CAD package, Caligari has to figure very high on the list of your potential purchases.

I'm sure we'll all see a lot more of this particular product in everything from engineering design to TV animation. I highly recommend it.

After last month's amazing Real 3D giveaway there's no doubt many of you are drooling at the wallet just waiting for an affordable, not to mention save-enabled way of reaching into the next dimension.

3D Master is the latest and by far the best of cheap ray tracers. Even though it's relatively inexpensive it nevertheless offers a very reasonable array of features, some of which are unequalled by even such illustrious names as Sculpt.

Unlike many other pretenders to the cheap ray tracing throne, 3D Master offers an interface that puts all the program controls and requesters at the mercy of the mouse while still offering a complete range of hot keys for the experts.

The design of the interface is excellent, being fast, logical and easy to use, but having said that I doubt whether it will be long before you, like me, become a hot key fanatic.

Even though the interface is excellent there is a subtle but nevertheless definable difference between 3D Master and some other interface-based programs.

3D Master stands somewhere between old-style software which wouldn't consider something as amateur as an interface and the new friendly face of ray tracing which would do absolutely everything without ever leaving your furless friend.

Even though all major events happen in tasteful requesters there's still the need for constant coordinates which determine everything from the size and shape of the object right through to the positioning of lights and their direction.

Fear not

For anyone with a pathological fear of X,Y,Z coordinates this won't be welcome news but believe me it isn't that bad and that's a quote direct from a dedicated Real 3D fan.

On occasion some of the requesters will leave even an enthusiast a little puzzled but this really only applies to the more complex shapes and requesters such as spirals.

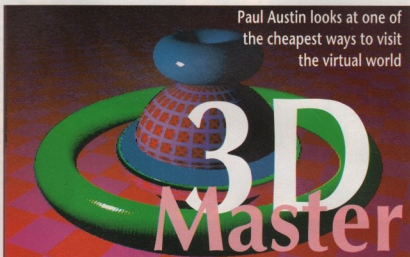

In most cases the various primitives such as spheres and boxes will do the job, with sizing and placement being a

simple matter of typing in three sets of coordinates for each. Although the X,Y,Z format can be confusing and occasionally time consuming the speedy rendering of "work in progress" plus the option for various screen formats and resolutions does make up for the tedium of typing.

Overview is perhaps the perfect way to describe 3D's view of the world. Like Calagari, which you'll find elsewhere in this issue of Amiga Computing, 3D looks at its little portion of space from a

Paul Austin looks at one of the cheapest ways to visit the virtual world

definable point which is suspended above a matrix depicting the surface of your creation.

Moving and examining your work is a simple matter of hitting the odd hot key to scroll in all directions, zooming in and out as required. It's true the lack of an orthographic or three way view does make accurate placement a little tricky but considering 3D Master is more of an artistic tracer than an exercise in engineering it shouldn't cause too much upset.

All the essential environmental controls are there, allowing everything from complete control of the palette to the intensity of light sources.

Like Sculpt, there are various options for ground design ranging from the

familiar chequered effect to the less common polka dot. Even a user defined floor space can be imported from your favourite paint package.

The last reference to importation leads nicely on to 3D's mapping talents which although limited do something which Sculpt can't manage, namely texture mapping any image on to elements within your creation.

The mapping works well, although it's impossible to make any adjustments to the way the image is mapped. The second and perhaps most important point is that only one type of map can be applied within each image.

The mapping process takes place thanks to a single image loaded in as a picture. Once loaded the program looks here for the texture which it then applies to every object which has its map option set.

Summary

As mentioned earlier, 3D is perhaps the premier cheap ray tracer but it does take more work than the average point and click package. Having said that it's quite fun learning the art the old fashioned way, so try not to be put off by a bit of typing.

As you can see from the screen shots the results can be impressive, if perhaps a little predictable. This tendency for

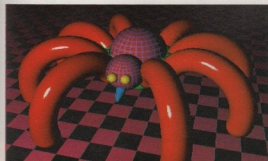

spheres, spirals and countless curves is due mostly to the lack of tools and the limited number of primitives. Both these points lead to a rather surreal landscape rather than the representations of the real world which more complex products can produce.

Image quality is generally impressive apart from the occasional case of the joggies which can give the edges of objects a very blocky appearance. This is due to the lack of anti-aliasing within the rendering engine and can only be cured by upgrading to products such as Imagine or, of course, Real 3D.

The only other complaint is the speed of rendering, which is fine while at work on individual objects but suffers badly when rendering full screens, so be prepared to leave your Amiga working through the twilight hours while you dream up your next design.

If you're looking for a solid first step on the ray tracing ladder 3D Master has to be a good place to start, providing all the essentials, with the odd extra thrown in for good measure.

on the Gallery

After last month's amazing Real 3D giveaway Amiga Computing's art department is bracing itself for the tide of ray tracing that's about to flood in - thanks to the bulging mailbags of many a bow-legged postie.

As if Real isn't inspiration enough, we're still offering a print quality, framed chromalin to the hero of this month's artistic extravaganza. Of course, next month's frame is just waiting for your latest creation, whether it be ray traced or the product of the paint package of your choice.

The incentive of recent Gallery giveaways and our framed chromalin has done wonders for both the quantity and quality of artistic submissions, so join what is the state of the art on the Amiga and post your latest masterpiece today.

To avoid any confusion, please write your full name and address on the disk and remember to title your work. After all Pic 1 isn't really a very awe-inspiring title for the work of a genius, is it?

'STATE OF THE ART' 16 BIT TECHNOLOGY

The mystery/role-playing adventure, combining History and classic science fiction, based on the world famous role-playing game by Game Designers' Workshop.

Space 1889: Discover a recreated solar system as envisioned by the scientific theories of the 19th Century and in the imaginations of such classic writers as Jules Verne, A. Conan Doyle and H.G. Wells. Written by the same team as the critically acclaimed 'MEGATRAVELLER 1'

INTERPLANETARY EXPLORATION

● Visit the canals of Mars and deal with warring Martians; explore treacherous swamps on Venus; travel through the mysterious underground caverns of the Moon... Even Earth is ripe for exploration and rife with intrigue...

● Planets and stars are accurately represented in Space. Actually navigate by the constellations themselves!

DIPLOMACY

● Overcome corrupt German conspirators, a radical Martian religious cult and the awesome intelligence of an advanced alien society that has escaped notice for thousands of years.

WEAPONRY

● Historic 19th Century weapons include 30 guns, 4 throwing weapons and 9 close combat weapons. Ranging from bolt-action rifles and single-barrel revolvers to swords and daggers.

PROFICIENCY

● Create five characters, male or female, from among six attributes and 24 skills, including Fisticuffs, Crime, Theatrics and Engineering. Control character development through a wide variety of careers.

HISTORICAL ADVENTURE

● Over 100 locations to explore on Earth alone - all depicted with historical accuracy and fascinating details. Including London, New York, San Francisco, the Far East and the Valley of the Kings.

TACTICS

● Realistic combat sequences let you control each character individually, while still giving general orders to the others.

VERSATILITY

● Meet and interact with over 500 unique characters, each with distinct personalities.

MEGATRAVELLER 1

Based on MegaTraveller by Game Designer's Workshop, the most popular science fiction gaming system and now the critic's choice as the Number One Computer Game!

AMIGA COMPUTING

Brilliantly balanced between complexity and playability - MegaTraveller 1's gameplay is a miracle... "The best RPG/Adventure game of the year."

CU AMIGA

A fantastic RPG with loads of puzzles.

AMIGA FORMAT

I can't think of any role-playing game which has the depth and richness of what's going on.

GAMESMAN

This game is truly, uncategorically "Mega"

ACE

A quantum leap for sci-fi RPG's.

AMIGA COMPUTING

"A triumph of intelligent game design."

THE ONE

No other computerised RPG comes as close to being an accurate conversion as MegaTraveller 1.

GEN 4

MegaTraveller 1 is THE Game of Today...

AMIGA POWER

"Terrifying depth, friendly and helpful controls, great atmosphere, excellent balance of strategy and action."

A wonderful piece of role playing software that everyone should play."

What's hot and what's not. Jason Holborn spills the beans on the latest from the Amiga games scene

OUTRUN EUROPA - US Gold

US Gold are a busy lot. Not content with having produced two Outrun games, they're currently putting the finishing touches to a third. As the name suggests, the action has swapped from the wide open roads of the good old US of A to the bumpy and winding roads of good old Europe.

The scenery isn't the only thing that has changed, however. The Ferrari has seen some action, so you've got some extra transport to help you travel across beautiful Europe. Of course, the Ferrari F40 is still parked on your driveway, but you also have access to a very swish

First level opens with a motorbike

Porsche 911 and even a Yamaha Grand Prix bike.

Ferry crossings are rather expensive these days, so you can make the crossing yourself using a choice of either a high powered jet ski or a turbo-charged speed boat.

It isn't all plain sailing, however. Not only must you keep your eyes open for the local police and secret agents, but you also have those infamous French motorist to contend with. These chaps alone can reduce even the most experienced driver to tears - just ask anyone who's taken a holiday in France! Look out for it in September.

Fans of Francis Ford Coppola's renowned Godfather series will be pleased to learn that US Gold have snapped up the rights to put the Corleone family's antics on to the Amiga.

Not wanting to screw up, US Gold have put this rather hefty job in the hands of French developer Delphine, the brains behind US Gold's great little murder mystery title, *Cruise For a Corpse*. The game is based on the aspirations and "business" intentions of the Godfather and the Corleone family. As always, someone is trying to muscle in on the action and it's your job to protect the Corleone family's interests using whatever means are at your disposal.

This usually means pumping someone full of lead, so there's bound to be lots of violence. Look out for it soon.

U.S. GOLD PRESENTS

The Godfather

Through the tunnel as you chase the crooks

Greetings and salutations. Welcome to the inaugural issue of Games On, a completely new concept in games coverage, but then so was Playboy. This 32 page full-colour supplement aims to complement the coverage of the latest hardware and serious software in the rest of the magazine by keeping you up to date with the essential games releases of the month, what to look out for and what to avoid like a particularly promiscuous plague.

We have devised an entirely new ratings system that will give you an in depth score to back up the opinions in the text of our reviews.

The system covers four essential areas all marked out of five: **Game Gongs:** Vision: does the game put you in mind of the Cistine Chapel or a chicken liver? **Audio:** are we talking about a Nigel Kennedy experience or something far more enjoyable? **Playability:** Do phrases like "Fun" and "Easy to use" spring to mind or is it more "Oh my, oh my, this really is far too difficult"? And finally, **Addiction:** Would you rather be monitoring Open University fashion than playing the game?

To back up the marks out of five we then give an overall percentage, the established and accepted method of marking games, but we have brought it up to date by using the **Gamer Gongs**.

Not only do we have reviews but we have **Onwards**, the monthly news and previews section brings you all the bits of up to the minute game info that you can bore your friends with at parties. On top of all this we have plans for two occasional features: **The Source**, giving the low-down on a software companies' upcoming releases; and **Face 2 Face**, interviews with programmers, minor celebs, and anyone else who fancied being interviewed when we need to fill pages. In short, a complete mini-magazine for the AMC reader looking for definitive game coverage.

To cap it all we are giving away the **Hakpaks**, your definitive filofax sized cheat, tip, and password guide to all those games lying around your cupboard that you couldn't finish. "Generous" does not begin to capture the nature of the **Gamer staff**.

You're going to love it! Jools.

ROBIN HOOD - Millennium

Millennium are a clever lot. They claim that the game system for their new Robin Hood game has been in development for over seven years now and whaddya know, it's being released just in time for the release of the movie of the same name, starring Kevin Costner.

This fact alone should ensure that it does very nicely thank you, but Millennium claim that the game is good enough to sell on its own. Hmm, I think I'll reserve judgement until the game is released in October.

FINAL BLOW - Storm

If your idea of fun is punching someone poor chap senseless, then **Storm's** latest could be for you. Based on Taiko's brilliant arcade machine, the game allows you to slog it out in the boxing ring against 10 of the toughest fighters in the world.

Using almost full screen sprites, the action is so hot that even Mike Tyson would probably throw in the towel. If all this has you punch drunk with excitement, you can check it out in September.

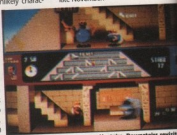

BONANZA BROS - US GOLD

Fans of Sega's fun little arcade romp *The Bonanza Brothers* will be pleased to learn that Mobo and Robo will be making an appearance on the Amiga very soon. These two unlikely characters have been hired to test the security system of a famous TV star.

Mobo and Robo must infiltrate a number of high security buildings, collecting evidence which will show up flaws in the TV Star's security system. This certainly isn't going to be an easy job, though.

Standing between Mobo and Robo and

their reward money is a vast range of high-technology traps and alarm systems which could catch even the most careful of criminals. Look out for it in late November.

Plan Nine From Outer Space – Gremlin

Gremlin have lost the plot, official in a fit of unbridled socialism – there can be no other reason for throwing this sort of money away – Gremlin have thrown caution, and a fair chunk of their profits to the wind and bought the licence to the worst film ever made.

They claim to have spent, ooh, minutes in negotiations and fought off stiff competition from someone they just can't quite remember in the race to sign up this, erm, title.

The game follows the plot of the original film, in which an alien race, having failed in their attempts to invade eight times previously, hit on the ingenious (orish) plan nine.

This cunning plan involves reanimating the corpses of the recently deceased humans and guiding them by remote control to wander around the towns and cities with their arms outstretched looking upset.

Featuring over 50 digitized sequences from the film, and programmed by Pixel Productions, formerly with Cinemaware – they must be desperate – it will be released with the least amount of fuss possible in early 1992.

Grand Prix – Microprose

Billed as a Formula One simulation, Microprose's Grand Prix brings to the small screen 16 "accurately mapped" 1991 Grand Prix tracks and 26 cars from all the well known teams.

Each car will be carrying the colours of its team, from Ligier to McLaren and Williams, and all will start the season by driving the way they drove in the 1990 season – won't be seeing much of Mansell then.

The game, programmed by Geoff Grammond of Rins and Stunt Car Racer fame, features four difficulty levels, manual gear boxes, (wooooh!), all the fun of a pit stop and much, much more. I should hope so too, because when it gets released in November Microprose will be charging a whopping £34.99.

Doctor Devious, misunderstood scientist or just an old square?

Super Space Invaders – Domark

1979AD. The world would never be the same again. The western world was invaded by six foot tall machines with a pixelated gorilla on the side. Never again would you be able to enjoy a decent pint without hearing those immortal sound effects: "Dum, dum. Dum, dum. Dum, Dum".

Well Space Invaders is back. Super Space Invaders from Domark has updated the classic that started it all, bringing in power ups, end-of-level mega-guardians and brand new attack formations that look set to bring the mother of all arcade machines bang up to date in your living room.

Super Space Invaders will be available from Domark in October at £24.99. Look out for it.

G-LOC – US GOLD

Bandits at 3 o'clock! There's a sidwinder on our tail... launch flares before we end up as toast!

Yes folks, it's time to disengage the brain and plug in the adrenal drip for US Gold's conversion of one of the hottest arcade shoot-'em-ups since Afterburner. Gold's conversion of one of the hottest arcade shoot-'em-ups since Afterburner. Gold's conversion of one of the hottest arcade shoot-'em-ups since Afterburner. Gold's conversion of one of the hottest arcade shoot-'em-ups since Afterburner. Gold's conversion of one of the hottest arcade shoot-'em-ups since Afterburner.

Let's just hope that US Gold can do a better job.

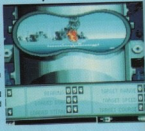

Silent Service II – Microprose

The original received more accolades than you could shake an Oscar in at 1986. The sequel appeared on the PC nearly a year ago and now you folks out there in AmigaLand can finally enjoy the thrill that is Silent Service II. Ahem.

The new missions include trying to sink a massive Japanese aircraft carrier in the harbour, and controlling a German U-boat in the South Pacific which is trying to sink Allied shipping. There will also be a campaign-style scenario which allows you to develop a career as a submarine commander.

The ships and submarines will be represented by digitized photos of the real thing taken from 24 angles. There should be no angle left unturned.

It will be released this month priced at £35.75.

Devious Designs – Imageworks

Dr Devious is a world renowned abstract scientist (what does he do, use polka dot chemicals?) but he has gone slightly mad. Well, he's gone very mad actually but who's counting?

The problem is that Dr Devious is very inspired by the art from Picasso's Cubist period, and his mad genius has developed a machine than can turn the world into a Cubist representation of itself.

But first he has to practise, and to do so he chooses well known monuments and easily recognizable objects from around the world and turns them into Cubist abstractions.

But one man can save the world: J J Maverick. Only he, under your control, can save the world from a fate worse than Rubik.

You must restore the world's monuments and everyday objects to their former glory.

This fast moving puzzle game will be released in October at £25.99.

WANTED

BRAVE ADVENTURERS

NO PREVIOUS EXPERIENCE NECESSARY

If you've ever pictured yourself as a Brave Adventurer but have been put off by the complexity of Role Playing Adventures this is the game for you.

Shadow Sorcerer has all the excitement and intrigue of AD&D's more complex adventures and also features the following "gamer friendly" innovations:

Shadow Sorcerer

- 100% "point 'n' click" icon control (no laborious typing).
- 3D isometric play area giving you more control on the playing environment.
- Control up to 4 characters in a life or death struggle against evil.
- Hexagonal grid map aids strategic planning.
- Combat action adventure.

This new concept in role playing adventures means that in minutes you could be confronting the Shadow Sorcerer, the down side is that within minutes you could also be dead!

Screen shots are only intended to be illustration of the game play and not the screen graphics which vary considerably between different hardware in quality and appearance and are subject to the computer specifications.

There are many pills and potions which claim to be able to cure baldness. Strangely enough, there has never been a product which can actually accelerate baldness. Until now.

Simply play Nebulus 2 for a few hours and marvel as you tear huge chunks of hair from your scalp in frustration. That's right, Nebulus 2 is a platform game, and quite a nippy little number it is, too.

We've all seen platform games before. Ever since Chuckie Egg flickered on to the screens of the BBC we've been inundated with them. Spaceman, miners, moles and hedgehogs have all appeared on our screens, and all had one thing in common: an uncontrollable urge to jump on to any horizontal surface with a merry beep. Pogo also suffers from this affliction, which is just as well - after all, it'd be a pretty boring game if he didn't.

As in the original Nebulus, Pogo must make his way to the top of the slowly rotating towers and claim them back from the evil Uncle. Scary name,

Pick a tower - any tower

huh? Once he has achieved this, he has to make his way back down again to repair all the damage inflicted by that nasty of Unc.

Then he hops into a waiting chopper (settle down at the back) and flies off to the next tower, via the obligatory bonus level. There are eight towers, but as you have to go up them, then

down, it's really more like 16. Now I may be being picky, but if you had to rescue 16 towers from a multitude of nefarious monsters, wouldn't you choose someone a little more, well, macho? Apparently not. The blokes in charge want Pogo, a small green blob with no arms. Who are we to argue? It wouldn't be Nebulus 2 otherwise would

it? Which leads us, in a roundabout way, to the game.

For those who are familiar with the first Nebulus, it's similar to that. So away and have a quick game while we explain the concept to whoever's left.

OK, imagine your standard platform game. Now take the platforms and wire them round a tower. Add some tunnels from one side of the tower to the other and sprinkle liberally with nasties and traps, and that's basically Nebulus. You can make a model using a toilet roll and a Cornflakes packet if it makes it any clearer, but get a responsible adult to help.

Now, the rest of you can stop playing Nebulus and come back. From here on things are different. This time Pogo gets various power-ups to help him along.

Not really weapons as such, these bonus items are picked up from parcels along the way and bless Pogo with such

essentials as a jet pack which rocks him round the tower killing everything in his way; magnets to lift him up to certain platforms; the spookily named Air Seeing Eye which allows Pogo to have a peek at what lies in store; jumping boots which have Air Jordan-style soles to give that extra boost; and matter transporters which can teleport Pogo from one part to another.

Also available are keys which, believe it or not, open locked doors. These icons add a much needed element of strategy to the game as they are hard to find and often essential to your progress.

This is what lifts Pogo-A-Go-Go above the morass of current platformers. There's always a way out of a fix. It just depends on careful selection and use of icons.

Life has its ups and downs in Nebulus 2

It's tough at the top

play, but altered the gameplay to make it a little bit more 90s.

The graphics are clear and colourful with plenty of variety. All manner of weird and wonderful creatures inhabit the towers and no two towers are ever alike. On top of that there's a neat little picture of Uncle on the front end, getting more and more irate as you progress further through the game.

It's nice to see that the scrolling of the towers is beautifully fluid, as in the first game, which helps to make the game a little easier on the eye.

The sound is bright and chirpy, with some atmospheric howling winds the higher you go. The tune at the begin-

ning is unremarkable but quite adequate given the quality of the sound effects. The lifts clank and creak, the magnets hum and give off metallic clangs when they hit a platform and the jet pack roars in a satisfyingly jet pack-like way.

But where Nebulus 2 really scores well is in the gameplay stakes. It's fiendishly difficult, but a password system means that you needn't go through all the levels every time you play.

There's also an option to play only the "up" towers, only "down" towers or all the towers, which gives you a chance to at least try other levels apart from level one. However, be warned, before

you begin playing pop out and buy a nice, smart wig!

Contact with monsters doesn't kill you, it just knocks you off your perch and sends you down a few platforms, just after you spent 15 minutes getting there. Aaaargh! But you soldier on, swearing blind that this is definitely your last go. This is the sort of game that you'll love and hate.

Not really a game for beginners, but veteran platform fans should lap it up. If you're looking for a new challenge, and don't really mind going prematurely bald, Nebulus 2 should fit the bill quite nicely.

What with the recession, rising interest rates and the price of a pint edging ever nearer to two quid, the building trade has enough problems on its plate without those presented by new German company Eclipse in this game.

Mr Bob is having problems with his construction sites – problems that make it almost impossible for his guys to do any work.

It all started when some forest crea-

tures, known as Mad Meanies, discovered they had a fetish for that bit of flesh that hangs out of the back of every construction worker's ageing Levi's. They started by gazing from afar but then soon became more and more bold.

Then they realised that they actually had a bigger fetish for the building tools of the guys with the bum cleavage. So at night they crept on to the sites and stole every tool they could carry.

This is where Mr Bob's problem lies.

The timing of this game is probably a little dubious. There is no obvious tie-in with the athletics, apart from the season itself, nor is there a big name licence. On top of that, the Olympics aren't until next year.

Basically there is no obvious reason to release an athletics game which offers nothing new. If the game was stunningly playable that would have been no problem – sadly there is not even that to recommend it.

Joystick wagging makes up the bulk of the 10 types of events, except the longer distance runs and the steeplechase. Jumping events and the javelin make use of what is called the

Hammer! Hammer! Here comes the hammer

Angle Sweep, positioned on one side of the info panel in the top left of the screen.

This is triggered by hitting the fire button, the idea being that if it is hit far enough in advance, but not too far, it will sweep through the optimum angle of 45 degrees at the moment the jump is triggered automatically. Meanwhile you are furiously wagging to get maximum speed in order to make the greatest distance.

The fact that the jump is triggered

automatically takes away the one realistic aspect of the game, and anyone with a strong wrist can waggle their way to success very quickly.

The same applies to the throwing events but this time the fire button is used to catch the athlete as he is facing the right way, and the constantly moving Angle Sweep is at the optimum central point. The energy level created by the wagging is shown at the right of the info panel. This juggling of the three elements, energy, direction and angle, is

Flowery it may be, but it has more thorns than the average rose

A common shoot-'em-up hazard that requires great skill and timing to get past. If, like me, you're not very good you might as well rely on luck

The middle of level one sees this ugly creature determined to stop you getting further. Three heavy shots to the eye will easily sort him out

These electric force pillars are easy to destroy but they take up valuable time as you try to manoeuvre in a very tight area

This high powered mechanical creature will not give you much opportunity to waste your shots

Now some might consider you lucky, others may consider you the unluckiest person alive. At the moment, as your ship careers through deep space, you may well side with the former. You will soon change your mind.

Delta Space is a mysterious section of the Universe. Very little of it has been explored. Well, the buses were rather irregular so no-one ever quite got around to it.

Those who did get to see the place, usually because they fell asleep on the way home from the pub, reported a system of five planets which were all part of the Aalan Empire, based on the largest planet of the system.

Each of the planets is populated by intelligent forms of life. None of them have heard of Stock, Aiken and Waterman. However, they being militarily weak, the fascist planet of Asia found no trouble whatsoever in marching in, crunching the daffodils and nicking all the kids' sweets.

It seems they also had a strange affinity for grabbing all the benches by the pool before you could get down there in the morning.

Now they have set their sights on somewhere else, somewhere more distant, somewhere far more beautiful. No, not Stansted Airport, but the Planet Earth - that radiant blue pearl in the

black fabric of space. Not slow on the uptake, though, the Planet Earth of the 23rd century is more than aware of the imperialistic threats of the overbearing Aalans. Long-range scanning - exceptionally long-range, actually - has been detecting the military build-up outside of the Aalan system for the past few years.

But the blue eyed boys and girls at the Planet earth were more than ready for the challenge. They had assembled a massive force.

The plan is to liberate and ally with the four smaller planets of the system, relying heavily on the activities of the resistance movements of the oppressed planets to discreetly place extra weapons pods along the chosen attack path.

Once the planets' defences have been destroyed, bypassed, conquered and quite unreservedly slapped on the wrist by the human force, the governor of the planet, usually exceptionally large, must be confronted and blasted.

This must be done for each of the four planets. Then they must be flown through again so that the remnants of the Aalan sympathising population can be wiped out. I think one of the planets may well have been called Dresden.

All well and good, but soon after the attack was launched it all went tragically wrong. The crafty Aalan fleet sneaked up behind the human fleet, shouted boo and blasted them to kingdom come. This is where my original thought

on the question of luck comes in.

You see, you survived, initially, by a blinding stroke of good luck. Then as you slowly spin through deep space contemplating exactly where they did put the toilet on your one-man fighter, it occurs to you that as the sole survivor you have no choice but to single-handedly take on the whole Aslan fleet.

It soon becomes too late to find the toilet as you realise you are the unluckiest man alive, but you have to live with it as you warily fly into the greedy sights of the enemy fighters. It is entirely up to you to save the world, you poor schmuck.

The more aware of you out there will have twigged that this actually translates into an eight-level shoot-'em-up that may well be hailed as "Bloody Difficult 1991".

The game is very much in the style of R-Type, even down to the weapon that increases its power the longer you depress the fire button. If you tell the fire button that its mother has died the gun gets really powerful.

The gameplay takes it a step further by animating parts of the scenery to make some areas of the level more of a puzzle-solving exercise than an index-finger exercise. These kind of decisions

have to be made very quickly as the screen continually scrolls to the left. The indecise will soon be lost in a shower of sparks.

The gameplay is extremely fast, decisions have to be made and reaction cannot afford to be slow, and this will make the game seem nearly impossible for the first few goes. But the few things you learn at each attempt can be used to gradually progress further into the game.

After a while each session will take you a little bit further. This style of gameplay means the challenge is high

but the interest and addictiveness are maintained as each game reveals a little bit more to tease the player into another game.

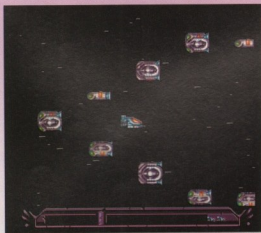

The graphics are of a very high quality, the ship animates superbly, there are a wide variety of aliens, and the between level screens are up to Psygnosis' standards.

Sound effects give a thumping soundtrack but the effects are very good, if a little below the standard of the other elements in the game. My only reservation is that you have to wait well over a minute

after losing your third life to be able to start again. This ruins the continuity and doesn't do much for your patience.

This game is a conversion form the C64 original, and they have managed to maintain the standards that made that version so playable. If you miss buying this you may well be laughed at by small children.

Early levels certainly don't shirk on aliens

Stand by for one of the best football games this season. Krisalis Software, after scoring an own goal with the original Manchester United, have scored a stunner with the sequel, Manchester United Europe.

The game, as is obvious from the title, ties in with Manchester United's triumph in the European Cup Winners Cup. What would Krisalis have done if United had been soundly thrashed by Barcelona in the final? Maybe 'Tranmere Rovers, The Play-off Edition'. To say the least, it's a big improvement on the original, with better graphics, sound and playability.

As Manchester United you can

choose to play in either the European Cup, the Cup Winners Cup or the UEFA Cup, and if you are lucky enough or good enough to win one of these cups, you are entered in the World Club Championships.

The control method in the game has been altered and improved. You can now head, backheel, chip and volley the ball, as well as using attouch to curl and swerve it to perfection. All throw-ins, free kicks and corner kicks are now controlled by a large yellow cursor which

you position on the field, then simply press fire to throw or kick the ball.

In between playing important cup matches you can choose to play friendly matches against great teams like Red Star Belgrade, Bayern Munich, Liverpool, Celtic, and several others from Albania, Norway and other smaller countries.

Krisalis have even managed to reproduce the other teams' club badges but not the players' names, so you get Mark Hughes and Lee Sharpe playing against the likes of A Pratt (Honest!) and other

such made up names. But can you name Dinamo Bucharest's first team squad? No, neither could Krisalis.

On the main menu, which sports quite a funky tune, the other icons are found. These enable you to save the game and change the length of a match, or the manager's name. You can also alter the number of players from one up to four, although you can only have three or four players if you have the special four player adaptor. In a four player game you could have two people

controlling the outfielders for each team and the other two controlling the goals.

Other icons include those for looking at United's and your opponent's statistics and watching the results and features of the European competitions, laughing as Wrexham go out in the first round.

The in-game animations are quite impressive, such as the goalkeeper punching out the ball and the wagging finger of the referee as your player gets booked or sent off.

Amiga users with a 1 meg machine are treated to the graphical delights of a substitute. Before coming on the field

play he can be seen doing his warm-up exercises, running up and down the touchline, back of the net and the delightful goalcrazer runs down the pitch and slides on his knees, taking the applause and cheers from the team's adoring fans, while the rest of the team do the "Gazza". A day at the zoo

So, here we are, crouching behind a novelty waste bin (in the shape of a rather dilapidated panda) in the Electronic Zoo. We'd better have a peep at the new exhibits before the zookeeper catches us.

First, a quick ride on the kiddies train ride around 'Unconvincing Plastic Dinosaur World'. Ah! What have we here? There's definitely something lurk-

ing in the dark recesses of that smelly hut. It's probably something highly dangerous.

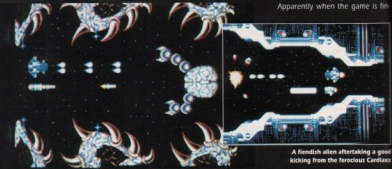

According to the little perspex plaque hanging lopsidedly from the chicken wire it's Cardiaxx (shootemuppus horizontalis), more in the mould of Defender than the rest of the current batch of shoot-'em-ups that seem to favour B-Type as a major influence.

Due for release in September, it looks

like it's going to blow away every other shoot-'em-up around, purely on the strength of the playability. But being the intrepid reporter I am, I venture into the lair of the beast. A quick leap over the fence and we're away, having a go in the demo version.

Now, you may well be wondering what the Sam Hill this has to do with a computer game. Well, this horrendous scenario that I described, the disappearance of eminent figures in our history, is the idea behind Zone Warrior.

The Earth of the thirteenth century has been under threat for years from a race of aliens known affectionately as the Geeks. So far they have managed to hold the Geeks off but now that may be extremely difficult. The Geeks have captured one of two prototype time machines that the Earth's scientists have been developing.

The Geeks plan to travel to key points in the development of mankind and destroy the pioneers of that time zone, like the chap who invented the wheel, and like the chap who discovered steam.

You have been chosen to travel in the remaining time machine and destroy the Geeks before they manage to disinvent the wheel, and very probably disinvent your existence as an indirect side-effect.

Flower power returns in The Magic Garden

Grobble the gnome contemplates putting a brick through the King's greenhouse

Under Stones house. Its name: The Magic Garden (Stranger's Garden).

The Magic Garden looks to be a bit of a new concept in games. After wiping the melted choc ice off the plaque we reveal a little of this curious creature's history.

A long time ago, at about the same time that "Allo Allo" was still funny, Grobble the gnome was banished from

his home for improvising the thrash metal remix of "Careless Whisper" at a local karaoke night.

As a penance for this heinous crime he was made to tend the King Gnome's garden. He's been there ever since. The only way for him to return to his idyllic life is to grow the key to the garden gate on his key tree – quite an obvious solution really – but that takes time and

while he waits for his key to grow he must keep the garden ticking over or else the King Gnome gets all uppity and pulls grumpy faces and has Grobble Burgers for tea.

Unfortunately for our Grob this is no ordinary garden. Nay, 'tis The Magic Garden and so magic things happen with distressing regularity. If the plants get thirsty they get up and walk off, if the pond dries up the fish bounce away, as fish do, and of course there's the common everyday gardening hazards such as underground monsters who steal all the food, and gangs of Gnome skinheads who make a mess of the garden, just like they did to the one on Blue Peter.

All is not gloom and doom though because Grobble is blessed with a shed full of tools, a magic coat to carry

history for Earth, hoping the outcome will be that by 2967 civilization has ceased to exist, or at least to be civil. Hell, it stopped doing that in the 20th century!

Enough of the politics – what the hell does this game do? Well, it's a platform game in which you control a character that has been described around the office as Turman on steroids, but I don't believe it's anywhere near that good. The main character's great and 'well-ard' but the gameplay is a bit short on action.

The main body involves leaping from platform to platform, ducking and avoiding assorted immovable objects that hurt, like spikes or venus flytraps, and trying to shoot the Geeks that have oh-so-cunningly disguised themselves to match their surroundings.

This bit is dead easy – the more difficult bit is wandering around the maze-like levels and trying to find all the hostages and the keys so that you can progress to the next level.

It's fine while you are doing it but when you lose your third life at the end of one of the levels it becomes a real chore, not a challenge, to carry on and do the whole level again.

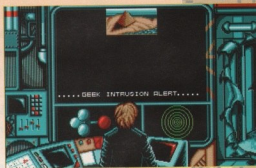

If you can overcome this though, or play in short bursts, it can be ok, if you don't mind a lot of exploration and map reading. It reminds me of a pint of Tennents - it's good...but not that good.

objects and a dragonfly who helps him zip around in record time. Perhaps an AK-47 assault rifle and some napalm would have made it a little easier, but The Magic Garden is strictly non-violent. So dragonflies it is.

The Magic Garden features some nifty graphics and gameplay not dissimilar to that so-called classic 8-bit game of yesteryear, *Pedro*—except *The Magic Garden* is much better. For those who want a different kind of challenge and are tired of the mental strain of blowing the poop out of yet another alien invasion force, it could well be worth a look when it's unveiled in mid-October for a trifling \$25.99.

The final under-wraps project is tucked away behind the Is It Dead Or Just Sleeping? giant tortoise enclosure. Even as we approach its cage we hear the subtle sounds of hardcore funk beating on our eardrums. So much for the quiet games. Another look at one of those oh so helpful plaques tells us that we are about to enter the Under Pressure enclosure.

Under Pressure: (*Scrollerus Arcaderami*) is, as you may have guessed, a return to those noble moral codes of computer gaming: kill everything that moves, and then kill it some more until it's had enough.

Why though? Why must we once more commit genocide on the inevitable alien hordes? Surprise, surprise! Your other half has been whisked away by, and I quote, "the very mean and nasty

Forget Nike, this year why not go for the all-over body armour look in Under Pressure?

baddie". It's nice to see that Under Pressure doesn't take itself too seriously, and this is mirrored in its graphics. Our hero starts off as a rather groovy young fellow, complete with shell suit, baseball cap and phenomenally huge trainers.

However, no matter how hip Troop tracksuits are, they aren't renowned for their bullet-proof properties so it's advised to pick up some chunky robotic body armour along the way. It's less trendy and hard to dance in, but a lot safer if you're thinking of taking on "the very mean and nasty baddie" and his entourage.

Plenty of colour and big, bouncy sprites distinguish this animal from others of its ilk and put it firmly in the same family tree as the highly acclaimed Metal Mutant. Sonically, too, it is easily recog-

nisable due to its 12 funky tunes which punish your speakers as you play.

The captors of this beast are Eldritch (alias Mark McCubbin and Steve Wetherill) and they hope to have vast numbers of them tamed and taught to jump through hoops by early autumn. Catch them on display in the shops then for £25.99.

So that's the up-coming attractions at the Electronic Zoo. One shoot-'em-up, one role-playing game, one arcadey scroller and, er, a game about gardens. Not a bad little bunch in anyone's book.

Of course they'd probably be happier in the wild, but then we wouldn't get our sweaty hands on them would we? Now all I have to do is sneak out of here without being caught...

Just some of the knee-tremblingly sexy sprites from *Under Pressure*.

Further down the chart Kick Off Winning Tactics hangs in there at number 40, Lemmings enjoys continued success, swelling the Psygnosis coffers at number 20.

The worrying thing is that the top 40 features only 14 full price games. This may look up however as the market goes into overdrive for Christmas and all the decent full price titles start appearing from the woodwork. Let's hope so because the first sign of a market in trouble is the proliferation of budget titles.

BART vs THE SPACE MUTANTS

OCEAN • Free with Cartoon Classics pack • 1/2 meg • Joystick

Just a normal night at the Simpsons' household

Bart hangs ten on his wheels

It had to happen. Move over Turtles. Bart's here. Ocean have snapped up the licence to convert the Simpsons game that appeared first on the Nintendo Entertainment System (as opposed to the coin-op).

Being the cynic I am, I presumed that Ocean would simply re-do RoboCop with different graphics. After all, that's close to what they did with Batman, Total Recall, Navy Seals and pretty much every tie-in since time began.

But the cunning devils have broken

the trend and, just to make me look like a pillock, have turned The Simpsons into a cracking little game with enough character to make it stand on its own.

The game has a truly incredible animated opening. In it, Bart sees a UFO land in his garden through his X-Ray specs and sets off to stop the Space Mutants from taking over Springfield. Throughout this clever opening scene the graphics are crisp and smoothly animated and the sampled speech is as clear as a bell.

Things don't go downhill from there either. The gameplay is fast and furious. From the very start the player is presented with puzzles and aliens to solve and to avoid.

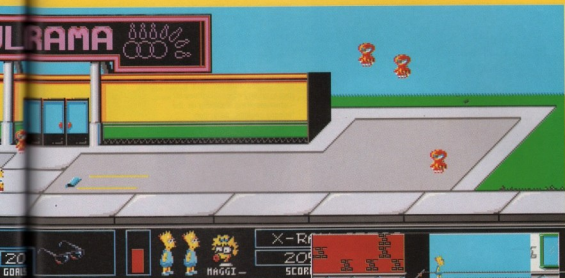

The view is side-on although the comprehensive moves available allow a significant amount of interaction with the backgrounds.

The game also scores well in that it gives the user a number of different ways to follow the main objective:

Bart must prevent the aliens from collecting the items necessary to build their planet-threatening ray gun.

On level one this means painting or covering up anything purple, and later levels offer such bizarre items

THE SIMPSONS: BART THE GENIUS

• Out late autumn

as hats, balloons, exit signs and nuclear power rods, all of which must be removed, hidden or collected.

The different ways to get these objects are never too obvious and some are fiendishly difficult, although he can make use of helpful items such as spray paint, rockets and catapults which he can buy with the coins that have been collected along the way.

Also available to help are the rest of the Simpsons. They can only be summoned by collecting enough proof of the aliens' existence to convince them to join the fray.

The action is non-stop and there are dozens of jokes along the way – for example, you can get Bart to ring Moe's Tavern and ask for Stu Piddiot or Al Coholic. The challenge that the game presents is quite considerable.

This is not a game that can be beaten easily. It should take even the most hardened joystick junky a fair while to get to the end of level one, never mind level five!

The graphics are beautifully drawn and the characters really do justice to the original cartoon, both in style and movement. The screen explodes with colour every inch of the way, looking for all the world like an episode of the 'toon.

Bart in particular is very well animated. Fans will be pleased to hear that his Lego people games are faithfully converted to AmigaVision.

Although the majority of baddies are simple bouncing space invaders, the programmers have remained faithful to

Acclaim's original and have managed to squeeze in various characters from the cartoon including Nelson the bully, Marvin Monroe the mad doctor, Ms Botz the babysitter bandit and, as they say, many more.

The sound isn't bad – the tune is catchy but nothing more than a basic rendition of the series' theme tune. At least it's not that Bartman record! The sound effects aren't ground breaking, either, but in the thick of the action sound becomes secondary.

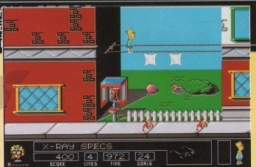

The game is certainly a joy to play and the programmers have generously given you three lives, although each life is capable of taking two hits. So that's really nearer six lives isn't it? Believe me, you'll need them.

The game is cleverly written so as to

Some of you out there may well be aware that the character that is taking the world by storm, via BSkyB in Europe, started life with his family on The Tracy Ullman Show in America about four years ago.

Bart and his family were such a success that they eventually got their own series. The rest of the marketing and T-shirt buying is history.

The only problem now is that Tracy Ullman is using Fox Television for \$30 million – what she calls "her share of the profits". I get the feeling that Fox Television won't pay up without a fight. This one could run and run.

Bart takes up the highwire to dodge the aliens

let you glimpse a new and tantalising section each time you play. The first time you play you probably won't do very much. The next time around you get the hang of dodging the aliens and maybe even getting some of the objects from them.

Carry on and you learn how to enter buildings to buy things. Then you reach the skateboard section and so it goes on. Just when you think you're about to eat your power pack in desperation (don't try this at home) you suddenly figure out how to get that elusive object or dodge that pesky alien and off you go again for the umpteenth time. This game could well cause many sleepless nights.

This review is becoming a bit like an advert for Ocean so I'll have to find something to moan about. Well, it is annoying that the whole game is totally joystick controlled.

Apparently, if you push up and left you run faster, but more often than not you'll just jump diagonally and land on an alien.

The inventory is also quite hard to control and often results in unwanted selection of objects when you really wanted to move Bart down on his skateboard. But that's about it as far as moans go.

So it's official. The Simpsons is brilliant. It could have been a real cock up – look at the Turtles game – but Ocean have

managed to duplicate the combination of laughs and gameplay that made Acclaim's original what it was. Who cares if I can't get off level one? I'm an underachiever and proud of it!

These starfish with the boomerangs have Tam and Rit trapped

This game is billed as "So cute it'll make you puke." Hardly one of the most enticing or attractive pieces of copywriting I've ever encountered. In fact, I think "Milwaukee, home of the serial killer" is a far more inviting, erm, invitation.

So what is this Rodland platform game gubbins all about? Well, it all starts in the fairy village - don't they all? - where something is definitely up. The formerly chummy, pally, dogfoody inhabitants of the village have been possessed by an evil force that was only previously kept in check by the presence of Mom.

The sad thing is that our Mom has been kidnapped by the nasty chap who started buzzing this evil force around in the first place. This, of course, means that none of the wee little furry things that ran around, shall we say, er, fouling, your garden can now resist this force.

They soon become furry freaks that run around angrily messing in your garden as well as trying to kill you. And while all this is going on, poor Mom is

STORM • £25.99 • 1/2 meg • Joystick • Out September

Poor Tam buys the farm, cops the big one, pushes up daisies, crows, shuffles off this mortal coil, passes away, kicks the bucket, pegs out, cashes in his chips, erm, dies

A minor explosion doesn't seem to disturb the worryingly cheerful, or thick, starfish

locked up at the top of the Maboots Tower, screaming and waiting for help.

Of course, anyone called Mom really ought to have some sprogs. She does: two as it happens. Tam and Rit are understandably miffed at their Mom being kidnapped.

There is only one solution: they dash off to the Elder to grab his Rainbow shoes and arm themselves with the Rods of Sheesanomo, a gift from their magically inclined father. Now they are fully equipped to go around and wop all the angry furries

over the head in an extremely violent, but insufferably cute manner.

These creatures take many forms: from long eared rabbits to polymorphs that lay out a very long tongue in an effort to catch you, not to mention the boomerang throwing starfish, or the sharks that try to elicit sympathy by crying before you give them the final blow of the three that all creatures must take.

This is slightly misleading, in fact, because you don't hit them but use your rod to pick them up and swing them back and forth over your head banging them against the ground until they disappear. If you're lucky they will turn into a bonus pick up - see details at top right of this screen.

The pick-ups can range from bonus points to flying bombs and sticks of dynamite, all of which can be used to destroy the creatures for even more points. Strangely enough, Tam and Rit also have a remarkable talent for summoning ladders from thin air. Quite what relevance this magical ability would have in everyday life I'm not sure. It's nearly as useful as a camel that can swim, but in a platform game the benefits are marvelous.

At will, Tam and Rit can summon a ladder to give them access to areas of a platform that may be blocked by the possessed creatures. Or, should the level allow it, they can take a ride on some of the balloons that float up from the bottom of the screen from time to time. The malicious among you will take great pleasure in

Squirrels, mutated PE bags and a few pansies try to convince Tam and Rit of their insanity

The Ziploc icon gives a massive flame instead of your rod. Extremely useful

The crystal is one of the best, pick it up and it spews out a shower of smaller crystals which destroy anything they touch

This bomb sends a plume of white light in either direction, wiping out everything on your level

Run over the bomb and it flies off in the direction you are facing. Be careful not to waste them because anything they destroy gives a bonus

The speed icon makes you just that little bit quicker

Pick this up and it will send four colourful balls whizzing around the screen killing anything they touch

The strangely delectable Mom languishes in jail

bursting your companion's balloon in a two-player game.

Every level is full of pretty flowers that, when collected, give a small bonus. If you collect them all before you kill all the creatures you are zapped into a bonus game where every creature left is turned into a radish that runs around in the usual aggressive manner. Every radish that gets bashed relinquishes a little ball that cycles through the letters of the word EXTRA - collect all the letters and you will receive a massive bonus.

This bonus is most useful in two-player games where one player takes the role of Tam and the other Rit. Between fighting for the bonuses and collecting as many flowers as you can, teamwork goes out of the window as the pitched battle for points rages onscreen.

One-player though is nearly as much fun as you dodge, climb and panic your way around the lumbering potato sacks, pathetic sharks and the radishes. Not only do you have the day-to-day style creatures, after every five levels or so you face a really big animal that can be a mutant bull, huge sperm whale (schoolboy humour alert!), or dangerously large crab. What fun it is!

This conversion of the Jaleco coin-op is better than the original, which suffered from being

an average copy, gameplay-wise, of Bubble Bobble. But this version adds to the gameplay and introduces some nice graphic touches.

These appear when time is beginning to run out on the level: just before the creatures turn into blue meemies and chase around madly, they find a piece of food and eat it. It is this that turns them into the aforementioned Lennon/McCartney creations.

For example, the rabbit will find a carrot, the monkey a banana and so on. It all adds to the fun and the rest of the graphics match the

colourful, though admittedly simple, screens from the coin-op.

Sound is unashamedly stereophonic, collapse on one side of the screen and the sound will come from the corresponding speaker. The playability is pretty good too.

It's not too easy to begin with but the 40 odd levels should ensure that you get your money's worth, especially if you get the chance to play it with a friend.

The only down point is that the gameplay might be considered by some to be a tiny weary bit repetitive, but with the humour, the speed and the mixture of different creatures you soon forget that all you are really doing is building ladders.

LAST NINJA 3

SYSTEM 3 • £25.99 • 1/2 meg • Joystick/Keyboard • Out now

The third instalment in this long-standing epic is about to be unleashed on the games buying public. Our hero is set to return to Tibet to face his arch enemy, the high priest who turned evil and made life a tad difficult for the friendly neighbourhood ninja.

Well, actually this is sort of the fourth instalment but only the third that System 3 are happy to endorse. When they were with Activision they did Last Ninja 1, and very successful it was too, but half-way through Last Ninja 2 they split from Activision, and signed the unfinished title over to them for Activision's in-house team to finish.

The game was then released and was acclaimed by all and sundry – the world, his wife and some of his more astute relatives – as being a bit of a dog. Now, System 3 were understandably a bit miffed about this, especially as their logo was plastered all over the packaging in a rather obtrusive manner.

So to redress the imbalance they got on with doing Last Ninja Remix, or This Is How Last Ninja 2 Should Have Been And We've Got Our Names As Developers To Think About. This version received the now standard rave reviews and everyone was happy.

Then having

recovered in a typically bullish manner, System 3 set about work on the third and final instalment in the series, imaginatively entitled Last Ninja 3.

Back to the story...

Like every good ninja, our hero has finally come to that ultimate battle. He has reached the pinnacle of his physical and spiritual condition, he is at one with himself and everything around him, peace flows like nectar through his body, nothing can disrupt his state of mind.

After meditating for what could have been an eternity, but was more likely to have been during the ads in Coronation Street, he has become aware of the task that lies before him. The evil aura that emanates from the Tibetan monastery where his nemesis awaits has reached him, and he knows that he is the only man on the planet who can even begin to think about taking this guy on.

Does this make him the stupidest man on the planet? Entirely possible – it also make him one big chuffing hero for the world, but no one will ever know of his epic struggle. Well, apart from you.

The monastery is divided into five levels of consciousness where, following the impressive opening animation that shows matey

The tap-dancing Judge looks unimpressed

boy sneaking over the wall, our hero must fight through hordes of soldiers and solve numerous puzzles before coming face to face with his arch foe, a demi-god slightly smaller than the Sphinx.

The five levels represent the four elements of earth, wind, fire and water, the fifth being void: a non-element that gives us the chance to see Ninja in space, sort of.

Each level, while graduated according to difficulty of the foes, presents the

player with different puzzles that must be solved if the level is to be completed. These puzzles generally involve finding a scroll that gives the key to the next level, and it may well be clearly visible but it's never easily accessible.

For example, the first level puts the scroll over a hole in a ledge. It's impossible to get to, but above the hole on another ledge is a rock.

The idea is to collect the items you need to make the rock fall – not too difficult, but a bit of deduction is required to

uss out exactly what is required. The fighting logic has been improved as well. Last Ninja Remix suffered slightly because the fight controls were very complex, especially if you wanted to make your character turn around.

These new controls are extremely straightforward: you just push your joystick the way you want to face in the time-honoured tradition.

This, together with the bigger sprites,

makes the fighting altogether more playable.

Fighting a bigger opponent gives you the chance to build up your Bushido Power. This is represented by a dragon at the bottom of the screen; when it is completely green you are at your maximum, making it easier to fight. The problem is that if you avoid fights or just blast away with the old shurikens, your Bushido is going to grow about as fast

as a cactus. You have to fight a lot but you also need to become familiar with weapons so that if you come across a nunchuka-wielding nasty you can fight him with your nunchukas and increase your Bushido from the experience.

But why worry? Well, the thing is, if your Bushido is not high enough it will be nearly impossible to defeat the end-of-level guardian, and all this puzzle solving and scroll finding would be in vain.

The game keeps the same 3D isometric viewpoint as in previous incarnations, and the sprite location has been improved so that the number of pillars or trees that the characters can walk, fight and pee behind has been increased, with no drop in quality.

Another big improvement is in the sprite detection. Previously, when you felt the need to pick something up you had to be in a pixel-perfect position, but now as long as it can be seen as available to pick up, merely bending down will be enough to grab it.

Graphically it looks pretty slick but it couldn't be called ground-breaking, apart from the apparent depth in the scenery. The gameplay is of a high standard: the puzzles are not as easy as you might imagine, but are of the kind that seem blindingly obvious once they've been solved.

Among this is the fighting of droves and droves of martial arts

experts who are more than willing to bend your knee backwards and call you Susan.

Sound is nothing special and you may find that the tune will soon annoy anyone in the area who isn't playing, but some bone-crunching contact effects go some way to make up for it.

But this game is more about gameplay than mind-blowing graphics, and these are more than adequate. It has action and brain-teasing by the bucketload. Well worth a look.

The touch of a button can allocate all the designers you need

Somewhere at the top of the Universe is a large glass orb. It used to be a six million watt light bulb but it popped about 30 years ago and no one could find a ladder big enough to change it.

Inside this glass orb floats a planet – a watery globe with no more land than 28 small islands.

This planet is in the first stages of humanoid evolution, and four god-like deity types are looking to expand into a new market-place from where they can build a monopoly.

They all happen across this planet at exactly the same time and they decide to take control of 100 men and fight for control of each of the islands one by one.

You can choose to play any one of the four gods and this allows the game to bring in four difficulty levels, the lowest meaning you collect a few rocks and chuck them about until the other side dies, the highest meaning you hang around a bit, invent something slightly more advanced and chuck that about until the other side dies.

This victory will see you becoming the main man of the island, but you then have to go on and try to win the battles for the other two because only by winning all three can you become the head honcho of the Epoch.

The Epoch is what divides the evolu-

tion of the planet into nine separate levels. So just how do you go about winning an island?

Well, each Epoch gives you an allocation of 100 men, which you must divide in a wide and sagacious manner between the islands. Once the number of men has been allocated, you must place your first fort in one of the square shaped sectors of the island.

The order in which you and your opponent(s) place your fort is determined randomly. Fortunately, while you fight for every island, not every god does. The size of the island will determine how many of the three opponents fight you for it.

Once you have placed your fort it's time to get down to the serious business of evolution. In the first Epoch you start at the very basic caveman Tech Level circa 9000BC, from there you have some serious decisions to make.

From the allocation of men to this particular island – usually just over 30 – you have little for them to do in 9000BC except design weapons. The more advanced the weapon you set them to design the longer it will take before the design is ready but the more likely you are to advance quickly to the next Tech Level.

Once the weapon is designed you can find out how many your resources will allow you to build. In 9000BC you

can build as many rocks to chuck around as you like, but as you progress men will have to be allocated to the mining of various materials so that your designs can be built in sufficient quantities to make a strong army.

When you allocate men to the army you can make a choice of how many bowmen, how many unarmed men, how many men with spears etc, but only if you have the resources.

The army is really your most important asset. Without a strong army you cannot attack with any confidence or chance of success, and the game will soon be over.

However, it may well be wise not to send your army out too early, because men in the field can't breed and swell the population inside your fort. You could send out 25 men very early in the game but then you could wait around and send out 125.

Once you have mobilised the army, with whatever ratio of weapons and men, you then decide which sector of the island to move them into. They can only move into a sector adjacent to themselves or one adjacent to a friendly sector.

If an enemy army is there they will attack it and the computer controlled battle continues until one of the armies retreats or gets wiped out. If

the army moves into an empty sector and is left to hang around long enough, it will build a new fort, which can then raise its own army, design its own weapons and live independently of the other fort or forts.

On an island where you fight two or more gods you can offer to ally with one of them to destroy the others. This means your army has less to worry about and can move about more freely as any sectors that belong to an ally are classed as friendly sectors.

Once the other two have had their bottoms kicked you can concentrate on the remaining opponent, your previous ally, and focus your energies on the one

goal of wiping the floor with this guy suitable enough to ally with you. The fighting remains the most important part of the game at all times, but as you progress through the Epochs and your Tech Level grows in leaps and bounds,

other pressures come into the gameplay. You have to look at the allocation of men to designing weapons, to mining resources, to building installations, to guarding the forts and the control of the army. Fortunately the very simple to use point-and-click system makes all this jumping around and number juggling extremely easy and very quick. This swiftness is one of the strengths of the game. For example, should an enemy army invade while the majority of your men are designing a new weapon, you need to be able to allocate them to the army very quickly, and you can.

The ease of use, the growing complexity as you get further into the game, and way you slowly realise how addicted you are make this a very strong game.

The other strengths lie in the graphics and the sound – especially the

sound. When each action is completed, or a warning message is necessary, then crystal clear speech speaks forth from the monitor in a very stylized manner that evokes the atmosphere of all those ancient Hammer Horror films.

For example, when a design is complete the Chief Designer says, with a charming speech defect: "The design's weady", or "Ergonomically twelftic". If you attack a sector and win, the Sergeant Major shouts: "We've captured the sector in a triumphant manner. The Home Guard, worried when under attack, yells: 'Tower Critical'."

On top of this remarkable studio-quality speech you get this very mellow New Age style soundtrack that The Orb would be proud of, and it helps build on the atmosphere that adds a lot to the game.

Graphically it works very well. Each Tech Level has its architecture and costumes for the chaps who run around fighting each other in this humorous parody of the diddy men [I think].

Onscreen at any one time is just one sector floating on an astral background of stars and cosmic gases, complete with pretty trees and looking very glossy overall.

The only thing lacking graphically is the fact that buildings just appear and

disappear – there is no degeneration or construction.

It is addictive, highly engrossing, looks great and sounds fantastic. Not only that, it is so simple to play a crab could do it. Let's face it, some god-games are an acquired taste but your dog won't even talk to you if you don't buy this.

SHADOW DANCER

Would-be ninjas stuck on US Gold's conversion of the arcade smash Shadow Dancer have Vicky Buckland in Dorset to thank for this great little cheat. It gives you infinite lives.

To make it work, pause the game and type in **GIVE ME INFINITIES** (including spaces). Your ninja – and his dog – will now be indestructible. Sounds pretty good to me!

F29 RETALIATOR

You may think you're pretty hard in your F29 Retaliator, but it only takes a single SAM up the bottom to bring you crashing to the ground.

To make life in the air a little easier, try this great cheat sent in by Amy Hutchinson – but it only works where she's from because she didn't include her address.

The tip arms your plane to the teeth with an absolutely disgusting amount of weaponry. To make it work, enter your name during enrolment as **CANAN**.

When you press Return, it will change to **OCEAN OK**, which means that the cheat has been accepted. Now all you have to do is to start the game, get up into the air and start kickin' some butt!

TOKI

Ocean's conversion of the arcade hit Toki is a pretty tough challenge for even the most experienced gamer, so this cheat from Andrew Hammond of Frome in Somerset is sure to please.

To get infinite lives, start the game, then type **KILLER**. An extra benefit is that you can now also skip levels by pressing F1 to F8. Nice one Andy!

DAYS OF THUNDER AND LOTUS ESPRIT

Talk about weird! Some cheats that programmers code into their games don't always have a positive effect – sometimes they're in there for entertainment value alone. Take, for example, Grem's Lotus Esprit Turbo game.

If you enter player one's name as **MONSTER** and player two as **SEVENTEEN**, you'll be presented with a frantic little shoot-'em-up.

Amiga Computing reader David

Collins from Salisbury has found another tip that has a strange but amazing effect on Mindscape's film licence Days of Thunder.

To access it, pause the game during the qualifying race and enter **COMET WITHME** (with no spaces). Your racing car will then sprout wings and take off. Just pull back on the joystick and you can have a race with Concorde.

Ooh er missus!

CHUCK ROCK

Unga bungal Poor old Chuck Rock may not be a prime candidate for Mensa, but he's a pretty tough character. To make his life slightly easier, try these cheat codes sent in by Tom Atkinson from Manchester.

NIGHT BREED

Considering the popularity of the film and the fact that Commodore bundled the game with the A500, very little has been seen in the way of cheats for Ocean's film licence of Clive Barker's Night Breed. Until now, that is. If you enter **RSEAN FROM THE DEAD** (with spaces), you'll get infinite lives.

Capture any sound you hear and replay it in seconds

Master Sound

It's so easy to use: Simply connect the sampler to your Amiga, load the software and immediately you have the ability to capture sounds with amazing accuracy.

Connect your compact disc player or personal stereo and digitise sounds to incorporate into your own games and tunes.

The supplied software provides complete control over the sampled sounds: Cut and paste them, flip and fade them and you're still only using a tiny fraction of the sound processing tools available.

Best of all, the comprehensive instructions will soon have you creating your own public domain demo disks complete with IFF picture files.

It's the perfect sound sampling package for beginners and experts alike.

Master Sound is a complete hardware and software sampling system for only **£34.95**

Bad spelling to cost pupils exam marks

There's mounting alarm about the appalling standards of spelling among Britain's schoolchildren. MFL teachers, parents and employers are all stressing the vital importance of being able to spell correctly.

Yet most homes have what could be the ideal means of teaching spelling — the computer.

Instead of zapping aliens it could be turned into the best weapon of all to deal a body blow to bad spelling. With the help of a brilliant new software package that not only

**Passing an exam . . .
applying for a job . . .
whatever you want to do in life you need to be able to SPELL!**

makes practising spelling painless but also loads of fun as well. SPELL is unique. It lets the user learn at his or her own pace. They can take as long as they like — or take on the computer in a high-speed challenge!

And this one package is ideal for everyone — with the lowest age group suitable for under-5s, while the more advanced words will stretch even the most able students.

It includes five different tests, each making use of more than 3,000 words — so much variety that you'll never get bored.

- 5 DIFFERENT TESTS
- OVER 5,000 WORDS
- FOR AGES 5 TO 15

SPELL! only costs £8.95. It is now available on disc and tape for six of the most popular home computers

"Back to School with Spell!"

FIVE ways to improve your spelling

In a Flash: Read the word as it flashes on the screen, then type it in. For practice runs, the word is left on the screen as it is typed.

Rocket: Hidden words have to be discovered in this hi-tech version of the old favourite Hangman. If they are guessed correctly the rocket will blast-off. Fail and all that's left is a load of scrap.

Lunar Buggy: Type fast for fun. The aim is to key in the word as it's pulled across the screen by the buggy. It has to be completed before the letters drop down a crater.

All Mixed Up: Jumbled letters have to be sorted out to find the scrambled word. To help beginners — and anyone else who is stuck — clues can be obtained at the press of a key.

Conveyor Belt: Words pass by on the screen and have to be remembered. Then they must be typed in — spell correctly. This is a challenging test of both spelling and memory.

All the programs have several options for extra flexibility — like a timer with on/off option to add that extra challenge.

In addition to using the 5,000 words provided, parents — or children — can create their own word lists for using with SPELL! This makes the package ideal for practising those hard-to-learn words, or for "Learn these spellings" homework.

Over the next three months I'm going to be having a brief look at the more popular Basic, C and Assembler offerings for the Amiga. As well as commercial products I'll look at some of the PD offerings and try to offer advice about the advantages and disadvantages of particular languages.

With Basic, for instance, it doesn't really matter whether the language is good or bad from an academic viewpoint. What matters is whether it will suit your purpose. If you want to write super-fast graphics then you'll find Basic a poor choice. If you're new to programming and want to find some way of making a start then Basic becomes a very good choice.

Don't think for a moment that a language must have access to Amiga graphics and sound to be any good – there are plenty of reasons why you might not need those Amiga-specific functions. If, say, you are involved with programs which must be moved from machine to machine then you'll want to avoid as much machine-specific stuff as possible.

Another reason why integration into the Amiga's environment might not be that important is if you just want to learn about languages in general. You might be studying computing at school or college and want extra practice at home, in which case you will invariably be required to provide straightforward code, free from the complications that intuition objects, such as gadgets and menus, provide.

One thing I should mention is that most of the time you'll only find qualitative comments about speed in these articles. I do not find benchmarks a useful measure of the strength of a language.

Marginal speed differences are rarely important and the areas, such as graphics and intensive mathematical calculations where benchmark calculations can usually help, seem on the Amiga to be a less useful measure of interpreter and compiler performance because it is usually the Amiga's library routines which are doing the real work.

All the interpreter or compiler has to do is push a few values into the 68k processor registers and then make a call to the appropriate library function.

This, incidentally, is one of the reasons for some compiler/interpreter speed benchmark comparisons showing little difference!

Microsoft Amiga Basic

This has you no doubt know is an interpreted Basic. It comes in for a lot of stick and some of the complaints, mainly the general slowness of the editor's window redrawing and requester-based syntax error delivery, are undoubtedly justified. Amiga Basic is, however, supplied free with the machine. Most Basic programmers, once past the initial stages, do not go from line to line making syntax errors and one way around the editor problem is simply not to use it.

I frequently write my Amiga Basic pro-

In the first of his three part guide to programming languages, Paul Overaa looks at how Basic shapes up on the Amiga

Blitz Basic and AMOS
Blitz Basic is a compiled version of the language and deserves a mention because it is fast – probably the fastest games code but as a language it is not particularly sophisticated in terms of the type of code constructs available. AMOS, as you probably know, is designed primarily for games writing and is interpreter-based. It already has a strong following and this is likely to increase. There is, incidentally, a compiler version due out in the near future.

Back to basics

grams using Lattice's LSE editor and only read them into the Amiga Basic interpreter when they are ready for final checking.

Hisoft's Basic Compiler

There are good reasons for choosing a compiler that will compile programs written in Microsoft-style Basic and the Hisoft offering is just such a compiler. It comes with its own editor which has none of the slowness of the original Microsoft offering and there is also an Extend package available which provides some much needed support for gadgets, requesters, graphics, sound and IFF file programming.

Hisoft's documentation is good and, as with all Hisoft packages, some implementation notes and appendices useful to the more advanced programmer are included.

If you have an interest in program portability then the Hisoft compiler is clearly one to go for. The reason for this is simply the continued prominence of Microsoft-style Basic in the micro world.

As well as the obvious ports of things like Microsoft's QuickBASIC, the ST version of Hisoft etc, there are many other links. I've even taken programs written in BASIC 80 which was supplied on an 8085 based machine called a Rair Black Box – bet

you've never heard of that one – and they ran virtually unchanged.

In general, porting all Microsoft-style Basics to the Hisoft compiler is a piece of cake and this, from a long term viewpoint, can be very important!

Cursor V1.0

One public domain offering which you might find interesting to look at is the Cursor package which is available from Akore as disk UT 4147. Cursor is a three pass Basic compiler for programs written in Amiga Basic.

While on the subject of PD, one of the best ways to learn Basic is to look at the code other programmers write. There are loads of Basic PD disks and the PR 9072 and UT4168 disks, also available from Akore, are particularly good.

GFA Basic

Despite all the good things that can be said about the Microsoft oriented offerings, it is true to say that there are still a great many things which can only be achieved by using the Amiga's library routines. This, for a great many Basic programmers, is a significant stumbling block. GFA Basic, from DataMedia UK, has undoubtedly solved a great many of these difficulties by providing extensions to the language which make the programmers' job easier. In some cases these allow the Basic programmer to do things which were seemingly impossible in Amiga Basic itself – expe-

cially in the graphics and sound departments. The main GFA Basic package is interpreter-based with the GFA compiler being an add-on/upgrade. The interpreter documentation, which comes in A5 ring-binder form, is very comprehensive and the compiler instructions are provided as insert pages which are then added to the existing interpreter manual.

Long standing problems, like converting IFF files to Basic Objects – the same format, incidentally, as used by Microsoft's Amiga Basic – are solved by utilities provided with GFA Basic. The only real disadvantage of GFA Basic is that the GFA extensions effectively render the code non-portable.

When you look at the alternatives, however, this is neither here nor there. If you used Microsoft Basic and worked out how to do the same things using library calls you'd still end up with the same lack of portability!

GFA Basic is brilliant and if you want to make the most of the Amiga environment, and the prospect of moving into the world of C and Assembler seems frightening, then this Data Media offering is the way to go.

There are, however, a couple of other offerings which are more directly targeted at Basic programmers who want to write games.

Last words

Whatever Basic you opt for, one thing is certain – you should make a point of knowing something about the core commands of Microsoft's Amiga Basic. Microsoft Basic is still regarded by many as the de facto standard and anything you learn in this area will stand you in good stead on various machines for many years to come.

Although I may be seen as being severely disabled through most people's eyes, I would strongly argue that I have plenty of ability. The truth of the matter is that the majority of people with disabilities are bursting with ability - it is just that society does not provide the access to allow that ability to be used.

I have been Tetraplegic for the past two and a half years, the result of a rare virus. During this time I have had to look at computing from a totally different perspective than the one I was used to. I will be looking at some of the ways that help to make the Amiga accessible to disabled people.

Alternative input

Let's take a look at some input devices first - after all, the computer is rather useless unless there is a way to actually operate it. The standard mouse is of little use to most people with any severe motor disability, or those whose strength is poor.

Taking my own case as an example, I have the full use of one arm but my body movement is weak. Moving a mouse around the desktop gets pretty tiring after a surprisingly short time.

The solution for me was a trackball, which is basically a mouse turned upside down. Instead of moving the mouse around a mat, with a trackball you only move the ball using the thumb. The Marconi 882 is a pretty good buy, as it is solidly built (mine has survived many drops onto the floor) and has a third button.

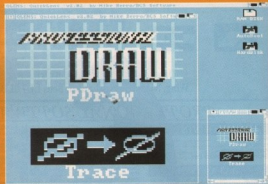

This can be used for dragging win-

dows and icons around the Workbench, making one handed operation easy. I know a number of people who manage to use this type of trackball quite efficiently using a mouth-stick, which is exactly what it sounds like.

Another alternative can be found in the form of the Concept Keyboard 2000. This is basically a touch sensitive keypad with up to 256 user definable keys. Using Think Ltd. Overlay Designer and Manager software, just about any application can be accommodated.

The gridded surface of the keyboard can be customised using standard A4 paper overlays. These are placed on the surface of the keyboard. The information on the overlay corresponds with the programmed keys beneath.

Using this principle it would be a simple matter for someone with, for example, severe speech and motor disability who has been using a mouth-stick in conjunction with a word board (where letters and commonly used words are mapped out on a board, and in order to

communicate the user spells out his comments by pointing at the relevant letters) to be able to use a word-processor without a steep learning curve.

The possibilities are endless with the Concept 2000. A Braille overlay could be designed for blind users to enable them to input data, for example. A series of preprogrammed overlays is provided for use with the "Class of the 90's" applications. For details of price and availability of the Concept 2000 contact HB Marketing Ltd on 0753 686000, and for the Overlay Designer contact Think Ltd on 021 384 4168.

Key depression

If you can imagine trying to use a computer when you have very restricted or uncontrollable movement, then one

thing you would want to avoid is too many keypresses. There are a number of solutions to this problem, and some even come freely with the Amiga.

The simplest method is to use the Alias command from the CLI, which allows you to replace commonly used strings with a shorter single command of your own. I won't go into any detail as I am sure that Steve Kennedy has covered this in his excellent "Beginners Guide to the CLI" series. Scripts are another example of using the Amiga's OS to run a complex series of commands by executing a script from a simple name.

There is also a PD program that has been around since the Amiga was first available, or at least it seems that way. The program in question is called Funkey, and it basically allows you to program the Function keys on your keyboard.

Each key can contain a number of macros by being depressed in combination with other keys. The program is ever so easy to set up, as you can see from the screenshot, and if programmed wisely with the commands you use most often it soon becomes indispensable.

The final program I will mention, and there are many like it, is SID. This is available as part of the Amiga Computing

Function key macros can save a lot of key depressions

Workstation disk, and is worth every penny.

SID was the first Shareware program I registered and I would advise everyone to do the same so Tim Martin can continue to develop such useful programs.

SID saves all the typing that would otherwise be needed to ensure good disk/file management. All the usual commands such as copy, move and make/dr are here as well as many extra ones. All you do is point and click.

First sight

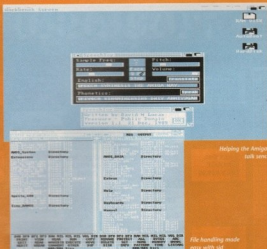

There are also a number of ways that the Amiga can be used by people with visual impairment. As a result of my illness I am partially sighted, although my eyesight is a lot better than many people's.

Two solutions automatically spring to mind when thinking about this problem. The first is speech synthesis, which I will come back to in a while. The second is that of text enlargement. There is a program built into the machine which has the ability to display and print in large text.

Of course, I am talking about Notepad. It is free, and it works, but it is very limited if you are thinking of trying to use it as your main word processor. However, many of the commercial word processors can display and print large text.

Ones to look out for are the graphic based programs such as Pen Pal, Kindwords, Pro-Write and also the very recently released Wordworth. Because I can only actually use one arm, I hit upon a snag when it came to writing letters. It is pretty damn hard to type capital letters, using one hand to try and hold down the shift key and type the character you want.

The answer was found in my word-processor of choice, Protext 5, which

allows the keyboard to be configured in such a way that the Ctrl, Alt and Shift keys become sticky. The upshot is that when you depress one of these sticky keys the next key pressed acts accordingly.

What about using the Caps Lock, I hear you ask. Well the sticky shift is one less keypress, so keeping the old important movement to a minimum.

Another text enlarger, which just so happens to enlarge graphics as well, comes in the form of a PD program called QuickLens. There are a number of these "lens" type programs about, but this is the one that I personally have found to be most useful.

It acts in much the same way as those flat perspex magnifying sheets you can buy to read books etc. You can make the QuickLens window as large as you like (the size gadget is there but is invisible), and as you move the pointer around your WorkBench or document, whatever is underneath becomes magnified.

The magnification level is set by clicking the mouse inside the QuickLens window and can be normal size, x2 or x4.

The screenshot on the opposite page shows icons on an interlaced WorkBench being magnified in the QuickLens window by a factor of four.

Talking Amiga

I mentioned speech synthesis in passing earlier, and now it's time to take a closer look. The biggest single thing in favour of the Amiga as a serious machine for people with disabilities is the speech capability.

The most unfortunate drawback, though, is that very little software has been written that takes full advantage of this. Surely there are not that many differences between writing screen reader software for an MSDos machine or an AmigaDOS machine? It is one area where I cannot understand, given the technology built into the machine, why it has not been fully exploited.

Some programs do make use of the speech aspect, and the new word-processor Wordworth is notable in that it allows the screen to be read out loud! Perhaps it could be something for the programmers of word-processors in

particular to sit down and think about. How about a program that would allow words to be spoken as they are typed, with a built in AI that could learn how quickly the typical inputs data and adjust its speech rate accordingly? How about a talking spellchecker, or even talking preferences? Surely it must be possible?

There are two PD programs that are worthy of a mention when looking at speech. The first is that golden oldie, SpeechToy. Although many years old now, SpeechToy is still extremely useful to anyone thinking of incorporating a speech element into an application for people with visual impairment.

What it does, quite simply, is translate between an input of English and an output of Phonetic language.

The second PD program I will mention is called Speakeime, and that is what it does. When called the program uses speech synthesis to tell you the time in the "it's almost five past ten" style. A useful replacement for the Workbench clock if your eyesight is poor.

I won't pretend that this is the last word on the Amiga as a tool for disabled people, because I am sure that things will continue to develop. I have not even touched on the field of learning difficulties, as this is an area I know very little about.

It would seem apparent, given the volume of educational software being written and the emphasis from Commodore, that the Amiga will succeed in this fiercely competitive sector of the market.

I hope that Commodore will fund the necessary research and development required to ensure that the Amiga takes its rightful place alongside the PC and the Macs, and to enable people with disabilities to gain the full advantages that the Amiga can offer.

It is not all roses though. I am not alone in being concerned with the problem of making Graphical User Interfaces fully accessible to the blind. Wouldn't it be terrible if all the advantages of computer independence were swept away in the name of progress?

What? Not another video digitiser! With so many now available, the video digitiser is rapidly becoming one of the most popular devices produced for the Amiga. And they certainly seem to be selling too – NewTek's DigView has become one of the most popular Amiga products ever, with units used throughout the world.

Is there room for yet another digitiser? HB Marketing certainly seem to think so because they've just begun distributing a brand new digitiser from German manufacturers VDT – don't ask me what it stands for! Its specification sheet certainly makes for impressive reading, but does it make the grade? Well, there's only one way to find out.

Hardware heaven

SnapShot Pro is a real-time video digitiser that allows you to grab full colour and monochrome images directly from just about any composite video signal, including both a domestic video recorder and a colour camera. OK, nothing special so far, but SnapShot offers some remarkable facilities which really make it worth checking out.

The SnapShot hardware consists of two separate boxes – the digitiser unit itself and an extra box called SnapShot RGB+, which is sold separately. That extra box is basically a glorified RGB Splitter, which is necessary if you want to be able to grab in full colour from a composite signal. It is possible to get by with just the digitiser, but you'll end up with a digitising system that's really no more capable than something like Rombos's Vidi Amiga.

On the front of the digitiser are three proportional knobs which are used to control varying aspects of the incoming video signal. There are controls for brightness, contrast and an extra "Lace" control which enables you to lock the digitiser manually on to the video signal when grabbing interlaced images.

To make adjusting this setting easier, a small LED flashes when the lace set-

ting is incorrect. All you then do is turn the control knob until the LED stays on permanently.

The RGB Splitter also has its own colour knob which lets you adjust the colour saturation of the signal. This too has its own sync LED, but the setting is handled automatically by the RGB Splitter. You won't usually encounter any sync problems using the RGB Splitter as long as the video signal being fed into the unit is of sufficient quality.

Digital image

After setting it all up, which takes no time at all, it's time to get down to some serious digitising. The software

This could be your terminal grab!

for this arrives on a single disk containing no demo pictures at all, which is quite surprising.

It's always nice to see exactly what a digitiser is capable of, especially when the majority of grabs you usually obtain from a new digitiser leave a lot to be desired. Thankfully though, it takes no time at all to grab good quality images yourself.

The SnapShot software is an impressive offering that almost fully automates the grabbing process. It's a very wish affair that makes use of the Amiga's powerful windowing facilities.

And, thanks to the fact that the main

Snap and grab!

control panel is displayed in its own custom screen, the whole thing remains readable and instantly accessible regardless of which screen mode you're working in – users of HAM digitisers will know what I'm talking about!

SnapShot fully supports grabbing in just about every Amiga screen mode and resolution, including overscan. You also have full control over the number of colours that can be used.

HAM images are obviously the most impressive, but SnapShot does a pretty good job of grabbing in other modes

too. DTP users will find the quality of SnapShot's high resolution grabs particularly useful for direct inclusion within packages like ProPage.

The grabbing hands

Depending on the type and size of image being grabbed, the digitising process is swift. If you grab in monochrome, SnapShot works in real-time, so there's no reason to pause the video signal, although the same can't be said for colour grabbing.

Because the unit doesn't include its own frame buffer – unlike the FrameGrabber 256 – the video signal must be paused. This isn't too much of a problem with newer videos, but owners of older digitisers may find this a problem because of the amount of image stability required.

If you can, it's worth getting your hands on a VCR that has a single frame advance facility. This is particularly handy because it allows you to find the most stable frame for digitising. Once again, most VCRs now offer this.

After you've found your frame, click the mouse and the digitising process is set in motion. Colour grabbing can take as long as 30 seconds, but the results are always more than worth the wait.

The overall quality of digitised images is certainly very impressive. The

Providing the competition

If you're after a professional digitiser, you're absolutely spoilt for choice. Here's a roundup of SnapShot's closest rivals:

Videon – Distributed in this country by Power Computing (0234 273000), this Italian-made digitiser is perhaps the nearest thing to SnapShot currently on the market. Its facilities are very similar, but unfortunately it doesn't quite have the pixel punching power to pose any real threat to SnapShot.

It too offers full colour digitising from a composite video signal using its own built-in video RAM and RGB splitter. Unfortunately, the quality of the images produced aren't a patch on those obtainable using SnapShot!

This is made even worse by some awful software and tacky digitising hardware – the knobs kept dropping off on the unit that I played with! Its only real saving grace is its price – coming in at a few pennies under £250, it certainly

wins hands down in the value ratings. Personally though, I'd rather spend the money on a decent DigView setup!

FrameGrabber 256 – If you're after a digitiser that can do it all, the Marcam's (0604 790466) FrameGrabber 256 is a good bet. It too is rather pricey (£75), but differs from SnapShot in that it's a true colour real-time digitiser. Thanks to its built-in frame buffer it can grab full colour images in 4096 colours from a moving video source, so there's no need to hit Pause every time you want to get a grab.

The quality of digitised images is certainly very impressive, but it doesn't quite match up to SnapShot when it comes to grabbing colour images from video tape. If you want to grab "live" images using a video camera, it's a very good bet, otherwise, SnapShot is better.

As always though, it's horses for courses, so I'll leave you to come to your own conclusions.

Mixing Amiga output and TV news to cobble up a new job for Peter Sissons

Barry Whitehouse takes a look at a new digitiser from Germany that promises to deliver even more pixel grabbing power

...a shining example of SnapShot Pro's quality

24-bit file format. Obviously it has full support for IFF, but even this has been extended to cover Commodore's new 24-bit IFF standard which was devised to keep all those new 24-bit graphics boards under control.

Because SnapShot handles its images internally in full 24-bit colour, it's possible to output digitised images for display on a 16 million colour graphics board like the Harlequin.

After a bit of tinkering around with file formats, I managed to get a couple of images working with a friend's HAM-E unit. Expecting great things, I must admit that I was a little disappointed.

The difference in quality between the original HAM images and their HAM-E counterparts wasn't really that great. In fact, the HAM versions were often a lot better. Even in HAM-E's powerful 24-bit mode, there was little or no improvement in quality whatsoever.

I'm not quite sure why this is, but I suspect that it may be something to do with the quality of the composite video signal. Like it or not, composite is pretty naff these days, especially when you compare it to much higher resolution systems like Super VHS and Hi-8.

With Super-VHS rapidly becoming a

Digitising by remote

Pressing buttons on your video to advance frames, pause and so on is all very nice, but SnapShot can take the drudgery away almost completely. Using a sophisticated remote control unit which plugs into the back of the SnapShot hardware, SnapShot can control your video's functions directly.

When creating colour animations, this allows SnapShot to get around the problems of slow scan digitising by automatically controlling frame advance. Once again, a fairly capable video recorder is needed if you are to get the most from this facility.

Before you can get the remote control to work with your video, you must program it. This is achieved by pointing your video's remote control at SnapShot's remote control.

It then picks up the signal from your video remote and stores it in memory. Once it knows how your video recorder controller works, it emulates these signals. Clever really.

Animation

Among SnapShot's more interesting features are its powerful animation facilities. Although not particularly new for a video digitiser – both Romb's Vidi-Amiga and Marcam's FrameGrabber 256 offer an animation option – SnapShot's animation facilities are second to none.

In monochrome mode, you can grab animations in real-time from the real world, but animating colour frames is somewhat more complicated. SnapShot allows you to create animations using a sort of stop frame-animation technique where each frame can be set up and grabbed manually. Once you have all the frames in memory, you can play them back with full control over the range and playback speed.

One feature that I particularly liked was SnapShot's ability to digitise frames at a given time interval. Simply by telling it how long it must wait between frames, you can create a sort of time-lapsed animation. For example, if you set up a video camera and pointed it at something like a pot plant, you could create a time-lapsed animation of the plant blooming and finally wilting.

Motion detect is also a very powerful facility. When selected, SnapShot continually grabs frames, analyzing each in turn. If the grabbed frame is identical to the previous one, it is discarded. However, if there is a difference, it is stored in memory and the motion detect facility is set in motion for the next frame. Obviously, SnapShot accounts for signal noise, so only relatively major differences are registered.

videophiles, I'm surprised that support for S-VHS hasn't been included. If it had, this would definitely have given SnapShot a boost.

Conclusion

So there we have it, SnapShot Pro in a nutshell. I must admit that I've had a lot of fun playing with SnapShot, grabbing frames from all my favourite videos and then playing around with them in DigPaint. There's something uniquely satisfying about being able to paint a moustache and glasses on to George Bush without becoming the FBI's number one target. Well, all this and more is possible with a video digitiser like SnapShot.

It's the kind of digitiser that is ideally suited to the home user. Most of us don't own such luxuries as video cameras, so being able to grab quality, full colour grabs from video tape is a real boon. It pays to have a video recorder with a good stable pause function, but even with a mediocre video I was able to get acceptable results.

OK, so we all want a SnapShot, but

Coming in at just under £80 complete, SnapShot certainly isn't cheap. With true real-time colour digitisers like Marcam's FrameBuffer 256 being sold at pretty much the same price, SnapShot is going to be in for a real struggle if it is to be successful.

It certainly deserves to do well, but I can't help thinking that perhaps it has been priced rather unrealistically. If it offered real-time colour grabbing, HB would be on to a winner, but as it stands I can't really see how it can justify its current price.

If money is no object to you and you're not really interested in real-time operation, SnapShot is worth checking out. Its quality is absolutely breathtaking, making it one of the best video digitisers available. If it was slightly cheaper – say £400 complete – it would be snapped up.

GRAND

THIS MONTH'S PRIZE

Last month every copy of *Amiga Computing* featured a unique GRAND GRAB serial number. The panel below contains 100 randomly selected winning numbers. If any of these match the GRAND GRAB number on your personal copy of *Amiga Computing* issue 40, you are already well on the way to winning a feature packed Datascan professional scanner from Pandaal.

● If your GRAND GRAB number from *Amiga Computing* issue 40 (September 1991) matches any of those listed above, carefully complete your claim form.

● Photocopies of winning GRAND GRAB number panels will not be accepted

● The first five fully completed GRAND GRAB claim forms to be drawn from the compiled entries on Thursday 3rd October 1991 will each win a Pandaal scanner.

● All remaining winners will collect various runner-up prizes including software, *Amiga Computing* subscriptions and T-shirts.

The prize

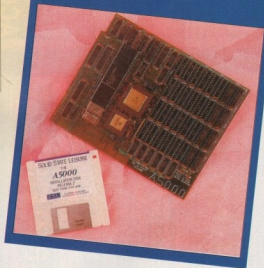

Are you looking to get the best out of DTP with your Amiga? The Pandaal Datascan is ideal for straight high quality images straight into your Amiga. Its maximum 400dpi resolution produces high definition mono images which can be imported into any Amiga DTP package.

You will wonder how you managed without one!

LAST MONTH'S DRAW

Last month we performed the first GRAND GRAB draw, revealing the lucky winners of three Solid State Leisure A5000/20 accelerator cards. Congratulations to Stuart Coppin from Leicester, David Riches from London and Fiona Congleworth from Aberdeen. Watch out for an accelerated postman near your letterbox soon!

NEXT MONTH'S GRAND GRAB EXTRAVAGANZA

Thanks to Amiga Computing you can get scanning with Golden Image or celebrate the launch of Amiga Gamer with the help of Kixx and Gremlin!

The number printed on the front of this very copy of Amiga Computing could be your passport to a superb free gift. Next month's GRAND GRAB will be bigger and brighter than ever with prizes ready and waiting for over 100 lucky readers.

30 GREMLIN GREATS

Do you fancy winning a copy of Gremlin's HeroQuest, the absorbing fantasy adventure where elves, wizards, barbarians and dwarfs do battle with dark forces in search of hidden treasure?

Or how about taking on the evil forces of Havoc in six massive levels of Gremlin's smash hit beat-'em-up Switchblade 2?

Next month you could cash in the number on the front of this very copy of Amiga Computing for one of these sensational Amiga games.

Those awfully nice Gremlin people have put not just one, but 15 copies of each of these great games up for grabs in our next massive draw.

50 KIXX CLASSICS

Not content with giving well over £700 worth of full price software away, the next Grand Grab draw will reveal the winners of 50 superb budget releases from Kixx software. By budget we don't mean cheap!

Kixx are responsible for re-releasing the very best in Amiga software at affordable prices.

Unforgettable hits like Switchblade, Street Fighter and Led Storm have made Kixx one of the hottest names around in software publishing.

2 GOLDEN IMAGE HAND SCANNERS

Don't panic if you haven't been lucky enough to win a Pandaal scanner in this month's giveaway.

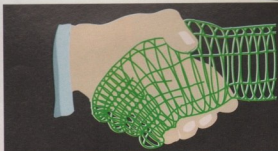

You still have a chance to make a break into the world of image processing. The Golden Image hand scanner is another superb 400dpi model which comes complete with powerful Touch-Up application software.

Two copies of Amiga Computing are already earmarked with winning numbers. Who knows, one of them could be in your hands right now!

THE AMIGA COMPUTING LUCKY DIP!

The giveaways just keep going! 20 GRAND GRAB winners will receive exclusive Amiga Computing goodies including binders, disk boxes, mouse mats, WorkStation disks and subscriptions.

American football

There have been several American footy games but only a couple have made any impression. **4th and Inches** by Accolade and **TV Sports Football** by Mirrorsoft are the ones worth looking at. **4th and Inches** is the older of the two and in comparison hasn't stood the test of time too well, although it's still a damn good American football game.

The characters on field are a little small and the movement is not what you would call smooth, but for budding head coaches out there it is still worth taking a look at especially as it is now on the Accolade in Action compilation with three other games, **Fast Break** (see Basketball section), **Grand Prix Circuit** and **Blue Angles**.

TV Sports Football, on the other hand, is still the classic American Football game, it quite simply can't be touched in this particular genre. Produced by Bob Jacob's Cinemaware (way before their financial problems), the graphics are, as you would expect from any Cinemaware game, quite exceptional and the sound is second to none.

The introductory sequences and the between quarter scenes are just fantastic. It gives you the option to play just single exhibition games or participate in up to 28 player-controlled teams. The actual game-play is quite difficult, the controls are challenging to get the hang of, but once you have, playing the game is a real pleasure.

This is the game that really does capture the feel of being there and is probably the next best thing. You can even play with a friend against the computer. A two-against-one situation may sound like it

TV Sports Football

MIRRORSOFT • £9.99 • OVERALL 87%

TV Sports Football – the next best thing to being there, if you can stand a bit of access time

makes the computer a doddie to beat but you couldn't be further from the truth. **TV Sports Football** is certainly no push-over and it will take you ages before you provide an adequate challenge for the game. But it is worth it.

The unbelievable thing about **TV Sports Football** is that it is now available at an incredibly low £9.99 thanks to Mirrorsoft's Mirror Image budget label. It's an absolute must for sports games fans – go and get it straight away.

4th and Inches

ACCOLADE • £24.99 • OVERALL 78%

4th and Inches from Accolade is worth a look but can't beat the 'feel' of TV Sports Football

Cricket

Although Soundware International have a supposedly amazing 1 Meg cricket game they couldn't get a copy to us in time for this feature.

But it is rumoured to be excellent. The only other cricket game worth noting at the moment is **Cricket Captain** by D&H Games, one of the smaller software houses maybe, but that certainly doesn't seem to affect the quality of their games. After all the Multi Player Soccer Manager has been taking the charts by storm.

You get complete control over everything. You choose the players' names, choose the team, and then play. Even when you are playing you get the option to play the

match yourself or get the game to play the match – a very useful saving feature.

There is so much going on strategy side of things that become hard to keep track of the game. Keep your eye on the contracts, the players' form, injuries, and that lot is just for starters.

Definitely worth a look if you find the Soundware International anywhere, which could be reasonably.

D&H GAMES • £24.99 (inc dongle) • OVERALL 78%

Amiga

Ever since computer and video games became popular people have wanted to try out their favourite sports. The very first would have been Tennis, or as it was known then Pong, that stupid game with two bats either side of the screen and a square ball bouncing between them.

Well thank god games have come a long way since then. Now just about every sport you care to mention has been transferred onto computers, plus a few that you won't have seen on TV. **LES ELLIS** guides you through the hits and misses of the world of the Sports game.

Karate

Karate is always well represented on the Amiga but most of these type of games include missions like rescue someone's beautiful daughter or something corny like that. The best pure known.

Programmed by Archer Maclean, it is a non stop whack 'em and stack 'em game. Up to two players can play and

the aim of the game is simple – gain as many points as possible and build up to a black belt. There are loads of different moves available and some rather strange effects can be accessed by pressing various buttons on the keyboard – try it and see.

IK+ is made even more value for money when you consider that it has just been brought out on the Hit Squad, Ocean's budget label. For a bit of nostalgia go and get it – it's a lot of fun.

IK+
HIT SQUAD • £7.99 • OVERALL 84%

Basketball

Again in this category a Cinemaware game comes up against an Accolade game. This time it's **TV Sports Basketball** from Cinemaware and **Fast Break** from Accolade.

TV Sports Basketball is the latest in the TV Sports range and will definitely not be the last to appear on the Microsoft label. Again it has some of the best graphics you are likely to see on the Amiga with amazing detail and animation all round.

You get to plan all the aspects of the game, including all your strategies and substitutions, and

then you get to carry them out on court. You get control over all the players in the team as you struggle to become the modern day Harlem

Globetrotters (fat chance).

Again, multi player options are available making this one of the best sports games of any category let alone just basketball. A definite hit.

Now **Fast Break** is another good Basketball game, but it just can't knock the TV Sports stuff off its pedestal of being the best around. Unfortunately really but that's life.

Fast Break has only three-on-three action for a start, whereas **TV Sports Basketball** has the full five-on-five.

The graphics are nowhere near as good – there are no close-ups of the shots like on TV Sports. The sound is like something from the dark ages. Not a bad game, but it just ain't like TV.

Fast Break

ACCOLADE • £24.99 • OVERALL 70%

On the face of it the actual playing sequences don't look all that different, but play the game and the differences will strike you immediately

TV Sports Basketball

MIRROSOFT • £24.99 • OVERALL 89%

Now this is what you call graphics – just look at the detail, but this is what we have come to expect from Cinemaware

a world of sport

Golf

Golf has always been a sport that has made me curious. For a start, why do golfers have absolutely no fashion sense? Have you seen those trousers they wear? Not a tassel or a pair of tight jeans in sight.

Then, if these golfers are so good why do they take so long to smack a little white ball from one end of a field to another, and why do they need caddies to tell them which club to use and what to do with it? What's the point?

The point is, if you could earn millions by hitting a ball with a bit of metal, would you care? No, of course not. The two golf games worth looking at are **Tournament Golf** by Elite and **PGA Tour Golf** by Electronic Arts.

Tournament Golf features three different courses with one or two players participating. The control method is standard enough – power bar plus hook and slice. This makes it pretty easy

to control. One problem with it, though, is that the screen update is pretty slow.

Although **Tournament Golf** is blessed with some nice graphics it was unfortunate to come up against possibly the classic golf game. That award goes to **PGA Tour Golf** by Electronic Arts. PGA is just a pleasure to play. It features three of the toughest courses in the world plus a 4th course designed to be as fiendish as possible.

These make up the four rounds of tournament play as you compete against 60 other pros all trying to make it to the top. The game is so addictive it is unbelievable. The only bugbear is that when two players are competing, when both of you are approaching the green you each get the green grid which takes a while. This only proves mildly annoying, though. So if you prefer your sports slower and gentler then go for **PGA Tour Golf**.

Tournament Golf

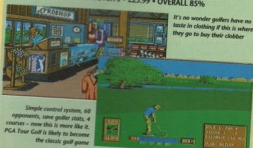

ELITE • £24.99 • OVERALL 67%

Making the unusual move of transferring a game from a console to a computer, Elite did their best but didn't quite make it work

PGA Tour Golf

ELECTRONIC ARTS • £25.99 • OVERALL 85%

Simple control system, 60 opponents, save golfer stats, 4 courses – now this is more like it. PGA Tour Golf is likely to become the classic golf game

It's no wonder golfers have no taste in clothing if this is where they go to buy their clobber

Racing

Probably the second most popular type of sports game after football, there have been some brilliant racing games around over the last few months. The undisputed King of the track is Lotus Turbo Esprit Challenge by Gremlin.

The speed at which the track

moves by is breathtaking. The game proved so addictive when it first came out that it caused many sleepless nights as people tried to complete that one last circuit, finishing in a high enough position to qualify for the next.

Team Suzuki

GREMLIN • £24.99 • OVERALL 80%

The two player game adds some real tension to the atmosphere as you both hack around the circuit at breakneck speeds. Another race game from Gremlin is Super Cars 2, different from Lotus Turbo Esprit Challenge but very nearly as good. The track is viewed from above and the cars are equipped with weapons to make overtaking that little bit more hazardous.

Again, in two-player mode it gets very addictive with around 20 courses split over three skill levels.

Both of these games received rave reviews from everyone when they were released and both are still excellent buys.

Incidentally, the original Supercars is now available on CD-ROM's budget label at £7.99.

Also from Gremlin comes Toyota Celica Rally and Team Suzuki (a motorbike racing game). These come just behind the others, but not far.

US Gold's entry to the racing game genre is Super Monaco GP – yet another impressive arcade conversion. The speed is surprisingly fast, with good graphics and sound all round. Pity it's only a one player game, but then so was the coin op so it doesn't lose any

marks for that. Although it has been around for several months it still excellent value for money even though it does prove slightly easy to finish.

Super Cars II

GREMLIN • £25.99 • OVERALL 91%

Indianapolis 500 from Electronic Arts is more of a racing sim than a pure racing game. The graphics are in 3D but are still very detailed and nice to look at. The game is difficult to play and probably won't appeal to the general racing fan. It is definitely one of the toughest games of this genre, if not THE toughest.

Indianapolis 500

ELECTRONIC ARTS • £25.99 • OVERALL 75%

More of a simulation than a pure racing game Indianapolis 500 is still a fine piece of computer programming and well worth looking at

Hockey

I've decided to put two games together under the hockey banner, Street Hockey by Gonzo games and International Ice Hockey by Impulze.

Street Hockey is a strange adaptation of the sport that seems to be

the up and coming thing just lately. It even features in a drinks commercial for Tango. Unfortunately Street Hockey isn't able to live up to that kind of reputation. It is extremely difficult to play thanks to a ridiculous control method.

The graphics are slow and the response time is awful. After you have hit a wall about four times while steering in the opposite direction you get more than a little annoyed. For a full price game it's a real let-down.

I wish I could say the opposite for International Ice Hockey, but I can't. It does have real advantages over Street Hockey – it's playable for a start, which helps. But the graphics are a little strange to say the least, with small sprites looking as though they could do with eating something fattening.

There are some very well done between game screens but these can't make the gameplay any better. One interesting feature is the "snaphor" where any plays you have managed to put together that you think are pretty good you can save to disk. But on

the whole wait and see if any other hockey games are coming out before you go for either of these.

Street Hockey

GONZO GAMES • £24.99 • OVERALL 56%

Baseball

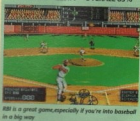

The latest and, according to Domark, the greatest Baseball game at the moment is RBI 2 Baseball. In case you didn't already know, RBI stands for runs batted in. It features all you would expect from a baseball game – easy pitching and difficult batting (as always) – plus some control over the fielding.

There are some nice touches throughout, especially on the score board when any decisions are made. There is some very good attention to detail, especially in the in field when the judges give their decisions at the plate. Domark

have done well with this Tengen conversion, and if you like a cracking baseball game you could do a lot worse than this.

RBI 2 Baseball

DOMARK • £25.99 • OVERALL 85%

RBI is a great game, especially if you're into baseball in a big way

TENNIS

The only tennis game worth mentioning at the moment is Pro Tennis Tour 2 from Ubisoft. This is destined to be an absolute smash hit (pun intended), especially with the likes of Agassi and Edberg whetting everybody's appetites with their exhibitions at Wimbledon and around the world.

Pro Tennis Tour 2 is a hell of a game – it has the lot. Excellent graphics, atmospheric sound and some animation that is so good you won't believe you are watching a computer. Look out for this on the shelves of your favourite games haunt, and if you see it, buy it.

Pro Tennis Tour 2

UBISOFT • £24.99 • OVERALL 95%

Volleyball

Now that Summer is supposed to be upon us you can probably go down to the beach and catch all the scantily clad men and women playing Beach Volleyball to loud rock music.

But if you can't stand getting sand between your toes or in your sandwiches then try it on your Amiga.

The only game I could think of in this category is **Beach Volley** by Ocean. But that's not such a bad thing because it's a cracking game and there isn't much that could come near it, except maybe a TV Sports version if it ever appears.

Beach Volley is certainly no young-

ster, having appeared back in 1989. It has stood the test of time quite well. Once you get used to the control method, which makes heavy use of all the joystick directions, it is a really good game to play.

There much satisfaction to be had in setting the ball and then jumping up and spiking it deep into the opposite court and out of reach of your opponents. You get to play all over the world against some of the best players. Beat them to prove that you really are the best of the best.

A gem of a game, even if it stands unopposed in the Volleyball genre.

Beach Volley

OCEAN • £24.99 • OVERALL 76%

San tans, expensive shades, ghetto blasters and gorgeous girls. Sounds fine to me - when do we go?

At least with this version you can't get sand all over the place. And you won't get mixed up like you would if you were playing it for real in this country.

Snooker/Billiards/Pool

Ever complained of there being too much Snooker on TV? Well now you can put even more on the old box. In the near future Virgin have 147 Snooker lined up for release.

I've had a sneak preview of it and it looks pretty hot. I can tell you!

Billiards II Simulator from Infogrames is a collection of new billiards games. One is French Billiards for the more strategy-minded among you. There is also American Pool billiards for the sportsmen, plus the addition of a billiards/pool game played on an eight sided table.

The graphics are adequate - after all there isn't

much you can do with a few balls and a piece of wood. The control is a little awkward and unless you are specifically looking for a billiards game I'd go for one of the others mentioned in this section.

3D Pool is an excellent pool game. The 3D works really well and the game is a lot of fun to play. It has recently been added to the Mirror Image label and at £9.99 is the best game of this ilk around - until Virgin release their snooker game, that is. The pick of the bunch.

European Superleague

CDS • £24.99 • OVERALL 81%

European Superleague is one for fans of footy management games only.

Football

Well, I've saved the best until last. The football category is probably the one that most people will be interested in. And it certainly seems to attract the software houses.

Of course you couldn't mention football without mentioning the immortal Kick Off 2 from Anco. This game has been around longer than most people would care to remember in one form or another and is considered by many to be the best of the bunch.

The two-player mode leads

to some competition that gets pretty hot. It is very challenging due to a tricky control

method but it is worth persevering with it just so that you can join the 'in' crowd of pretend Kick Off 2 champs.

In a slightly different vein is Subbuteo - yes, they have even simulated the finger flicking fun of table top soccer. Unfortunately this is a pretty stupid idea for a game and the gamesplaying public showed this by avoiding it in their droves. Bad control, naff graphics and oh so slow gameplay lead up to a certain miss.

There are couple of football management games that may be worth a look. Firstly, **Multi Player Soccer Manager** from D&H games is still a cracker, although the actual managerial section does look a little bit similar to the Cricket game (or should that be vice versa).

It is still in the computer game charts months after its release. The strategy gets pretty intense as there is always loads going on. If you really want to know what the real managers go through in their careers then take a look at this.

Secondly, **European Superleague** takes a slightly different element. Everybody knows that the European Superleague doesn't actually exist (yet). Again there is lots going on all the time to keep you busy. There are some great graphics used throughout, especially in the match sequences.

One problem it does suffer from, however, is the amount of time spent accessing the disk.

SAVE MONEY AND THE ENVIRONMENT

In 1989 Western Europeans threw away over 128 million printer ribbons. They weighed over 9,000 tonnes in total and would reach **right around the world** if laid end to end. A used ribbon cartridge is being thrown away somewhere in the UK **every second** of every day.

You can help put an end to this environmental waste and save some money at the same time thanks to **RE-INK**, a revolutionary new spray which brings new life to exhausted fabric printer ribbons.

RE-INK is cost effective and simple to use. Simply open up your plastic ribbon cartridge, spray a few squirts of **RE-INK**'s special ink and lubricant formula and your ribbon is good as new – sometimes even better!

Seagate rescue

I was reading your ACAS column in the June 1991 issue and can offer a source of information to Mr Smith of Manchester who was having trouble with his Seagate drive and C Ltd controller board.

C Ltd went out of business over a year ago, but a company called Micro-Dyn (2011 S Washington, Wichita, KS 67211, USA tel. 316-265-2661) has obtained all rights to previous C Ltd products and is actively supporting them.

I believe the ST-225N has 615 cylinders and four heads, and is a 20Mb MFM format drive with an access time of 68ms. Write precompression usually starts at cyl 300 on those units.

The card sounds like an early C Ltd unit, and what little I know of them is that they are non-auto-booting and usually fired up with a C Ltd boot disk called SCSI.DOS. The utilities for formatting the units are usually on the SCSI.DOS disks, but if you don't have the C Ltd manual, you'll need a technician who is adept at SCSI interfaces and drives. Hope this information helps some.

Michael Lesperance, McChord AFB, Wa, USA

That explains why our efforts to contact C Ltd were in vain! Thanks for the tip, Michael. If Mr Smith is reading, we hope it solves some of his problems.

Tower Amiga

After reflecting that my A500 reminds me a little of an Acorn Electron (Treasure - Ed), and that it'd look a lot better in a mini tower sporting all three disk drives accessible from the front of the machine, I set about converting it into a tower Amiga.

Floppy drives can be removed quite easily from their mounts and screwed into PC-style mounting rails, and it is a simple job to remove the PSU from its case to fit it internally on the new chassis.

The motherboard, once removed from the original case, is screwed into the new case using plastic spacers, and connections are made to the outside world using nice 25-way ribbon things. There's plenty of room left inside the new beast for hard drives and things as well.

Oh nol What about the keyboard? Out of its A500 case it looks horrible. The motherboard connection can be made to the DIN socket on the front of the new case and, with a nice curly wire and DIN plug from Tandy, a lead can be constructed for the keyboard. So where can I find a case for the darn keyboard?

Now, I might play a lot of games and things, but an Amiga without its keyboard is about as useful as a working ST. My best buddy sits semi-naked on the

bench and I can't bear to see her unhappy. I've been told the A2000 keyboard won't work and can't think of anything else. Any ideas?

T A Seaman, New Malden

Congratulations on winning the Metamorph-of-the-Month competition! Turning your A500 into a mini tower is a dream shared by many an Amiga owner as, regardless of the cost-effectiveness of such a solution, they love the image boost.

The only add-on keyboard I know of is the Checkmate Digital unit. For £59.95, you can experience the joys of a rattling, badly fitting, bouncy mounting whose only positive features are that it is the ONLY one available and that empty it serves well as a coffee tray.

If you've gone to the trouble of assembling the tower, however, the CDL unit is the only serious option. Call them on (071) 923 0658.

Short circuit

I read with interest the letter from Andy Hamilton in the August issue, since I fixed an identical sounding problem on my A500 last month.

One month after the warranty had expired (naturally), the internal drive started giving spurious read/write errors at regular intervals. Having checked for viruses, head alignment (by formatting a fresh disk, then trying to read it back), and using a head cleaner, all to no avail, I decided to have a look myself rather than spend a fortune having it repaired.

After much poking around inside looking for loose chips and dry joints - the most common causes of these kind of hardware faults - I

finally noticed that where the RF shielding had been touching the cables connecting the drive to the motherboard, the insulation on the cables had been partially worn away.

Not enough was gone for the wires to short to each other, but enough damage had been done to let them short to the shielding. I was able to fix the problem by bending the metal plate back so that it was well clear of the wires, though even if the cables had been more badly damaged it would still have been much cheaper to replace them than to have the machine repaired.

Since the design of the A500 means the shielding will usually be rubbing against the drive cables, I suspect that this is a common fault on these machines. I would suggest readers whose machines are out of warranty carry out some preventative medicine by bending back the metal plate before the symptoms occur, since if drive leads start shorting out they could cause serious damage.

David Kirby, Swindon

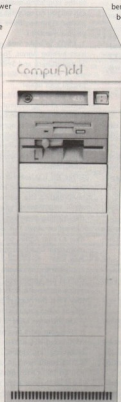

Inexperienced A500 owners could also cause a great deal of damage if they started poking around in their machines with a screwdriver! The tip is appreciated, but remember if your machine is under warranty or you're at all doubtful about opening up the Amiga, DON'T DO IT!

Bitmap bother

I'm having problems with my hard drive. Every time I boot up it takes three to four minutes of messing about before it validates itself, and won't finish loading programs until it's stopped messing around.

If I try to save something before this time is out, I get an "Error - is not validated" message and the file isn't saved until validation is complete. If I turn off the computer before validation is finished, I get the same message immediately on booting up again.

I tried to get an answer from the Amiga dealer in

A tower of strength?

Radio mentals

Duncan Webster's letter on the subject of sending data from one modem to another using a walkie-talkie prompted several replies, some of which were more constructive than others. Here's a selection for anyone thinking of putting an Amiga on air.

I should cocoa!

I tried exactly the same thing as Mr Webster. With a hot chocolate tin (Woof! - Ed). No - don't turn the page or put down the mag yet. Simply by using it as an aerial booster, all I did was cover some stiff copper wire on the outside and used the rest as a down lead to the walkie-talkie.

Making the down lead is very easy. When you have finished wrapping the copper wire - about 3 feet will do - use another foot of wire as a down lead by wrapping it with insulating tape. Be careful, however, to use some form of multimeter as you can only use so much unlicensed radio-wave space. You could find yourself on the amateur band and get nicked for not having a licence.

Anyway, connect the down lead with a crocodile clip to the aerial and hope for the best. I'd say a 300 to 1200 baud modem would suit better over the air as faster modem speeds often scramble up the data. I had a very interesting talk with a friend this way! You could try Maplins for information on their Heathkit equipment for gathering clear signals.

Simon Canning, Marlow, Bucks

You'll have a more than interesting conversation with Mr Policeman if you're not careful! By all means, experiment with your Amigas and get the best from them, but try not to land in court while you're at it.

If in doubt, check the CB and amateur radio regulations before rigging up your Amiga in this fashion.

Iceland but they don't seem to know much about computers. They mostly just want to sell agricultural machinery. I'm enclosing printouts of my startup-sequence. Could it have anything to do with the WAIT command?

Jon Amanson, Hafnarfjörður, Iceland

The problem lies not in your startup-sequence but in the root block of your hard drive. This is where the "Bitmap" resides, a file you can think of as a digital map of the location of every file on your disk.

If, for example, two or more files are trying to occupy the same space on a hard drive, the bitmap will freak out and fail to validate. This is the most common cause of unvalidated hard disks and, although very annoying, is quite easy to fix.

The best program I've used for validation problems is FixDisk 1.2. This was given away on our March coverdisk and is also available from most PD libraries.

To fix your validation problems using FixDisk, click on the "Directory" button, then on D10: The program will run through the contents of your hard drive and alert you to any problem files. It will then give you the option of deleting the offending file or the one it is clashing with.

DO NOT delete the file offered to you. Instead, delete the "other" file with which the first one is

Illegal speagal

It is quite possible, technically, to link a modem to a radio transmitter in order to send data to a remote station (millions of kilobytes travel that way every day) - Ed) as it makes no difference whether the link is a phone line or a radio wave. Where Mr Webster is falling down is probably in the equipment he is using.

The fact that he describes his radio set as a "walkie-talkie" leads me to believe that he is using a CB hand-held transceiver and if this is the case he has several problems. The first of these is that there is probably no provision for an external input, thus preventing a direct connection between the modem and the handset.

The next problem is one of low power. Very few walkie-talkies are capable of the full legal limit of 4 watts. Add to this the problem of interference on CB frequencies and the chances of a clean exchange of data between the two stations are very doubtful indeed, even if only over a distance of a mile.

One final point against using this method of data transfer is, and I quote from the official CB Radio licence terms and conditions: "The licensee may use a CB station for sending and receiving only messages in plain speech".

In other words, the transmitting of computer data is illegal on these frequencies and may bring the DTI knocking on the door, in which case sending the data down a phone line could well work out cheaper after all.

Cyril Mokes, Nottingham

Hmm - your letter puts a bit of a dampener on the issue, but the legal situation can't be contested. We're not going to encourage readers to break CB regulations, but I'm not sure that Mr Webster was using a CB radio, so...

trying to compete for disk space. Don't ask me why, but FixDisk crashes if you decide to delete the first file offered to you.

Once you've got rid of the culprit, re-boot and check your drive again. Be warned that you may have to do this several times if your bitmap is severely scrambled.

Printer problems with QED

I would appreciate some help regarding the SID on the workstation disk. I'm using QED for editing script files to use with a menu program.

I've copied QED to a new disk and made it auto-booting as explained in the July issue of your magazine. My problem is how to get it to print? I keep getting a message "cannot open printer device".

My Workbench and Workstation have been correctly set up so why aren't I getting any results?

Mike Hemming Redditch Worcestershire

Well as any regulars will know printer problems are the most common cause of sleepless nights in the computing community. Fortunately in your particular case the answer appears to be a simple one.

Your problem is probably the lack of a dev directory on your new disk, within which you should create a printer directory into which should be placed a copy of your printer driver from either the

Workstation or Workbench. Because your new disk autoboots, the Amiga regards it as the system disk and will look only there for any external devices or drivers that QED might require.

As a result it will ignore any other disks, even if they are set up perfectly for printing. You shouldn't have any problems creating and copying the various directories and files thanks to good old SID.

Have fun...

Hard choices

I have a 1.3 A500 with A501 memory expansion and external floppy, and recently bought PageSetter II which is an excellent low cost DTP package. However, I seem to be continually running out of memory, and especially chip memory when using PageSetter. I realise there are a few options open to me, but would like help in choosing the most sensible.

1. Is it easy to fit a Fatter Agnus and if I fit it myself will I invalidate my warranty? If so, will it be invalidated if fitted by an official dealer?

2. Will fitting the ICD adRAM board invalidate the warranty?

3. Is it better to buy a hard drive and memory expansion, or hard drive with memory expansion on-board, such as the Evesham Micros 40Mb NEC with 2Mb fitted? The latter is the cheaper and therefore more attractive option.

4. Would I need an upgraded power supply?

Brian Nisbet, Glasgow

You seem to have a fairly well-balanced approach to the upgrading question, so there's not much I can tell you except make your mind up and take the plunge. However, there are a few points to make on your questions.

1. Check to make sure your A500 doesn't already have a Fatter Agnus. There are PD programs such as AgnusCheck and SysInfo which will tell this for you. If you have an old Agnus, you'd be advised to consult your dealer.

Commodore don't have an Agnus upgrade option at the moment, but a qualified official dealer should be able to fit one with ease. Check before you take this option to make sure it doesn't affect your Commodore extended warranty. There should be some way of ensuring the warranty is still valid if you have the modification carried out by an official dealer.

2. Yes, the ICD board connects to the Gary chip, so you have to open the A500 to fit it properly, thus invalidating the warranty. If you're going to attempt DTP work, you'll have to upgrade your chip memory somehow, and the ICD board's Gary connection allows the use of 1Mb chip ram if you have a Fatter Agnus, but losing your extended warranty could be a high price to pay for the extra half meg.

3. It's horses for courses as far as your hard drive choices are concerned. The advantage of drives which come with slots for extra memory is that they keep the number of bits and pieces sticking into or out of your machine to a minimum.

On the other hand, if the drive blows up on you it takes your extra ram with it. The Evesham Micros A500-based NEC drive is a solid and reliable, if not blisteringly fast, option.

4. You won't need an upgraded power supply if you go for a hard drive with extra memory on board, as these all come with their own power supplies. If, on the other hand, you buy one of the larger memory upgrade boards, you'd be advised to play safe and buy a beefy PSU as well.

Amiga Computing

129

Our hero is much more than just a removal man and to prove it I'll be looking at what lurks among the thirty command buttons that are all too often overlooked.

Before we start please spare a thought for the long-suffering author, namely Timm Martin, who richly deserves any contributions you may feel the urge to send. If anyone deserves a contribution he does. You'll find his address on the last page of the WorkStation manual.

PRINT, EDIT and XEDIT

The Print option is rather self explanatory and providing you've installed the correct printer driver there shouldn't be any problems.

Installing a driver is a simple process - just select the driver of your choice and use SID to delve into the devs and copy the driver into the printer directory.

Next on the list we have Edit which as you're probably aware enlists the help of QED by first loading it and then automatically listing the script file ready for editing. Ideal for the ever-changing startup-sequence.

The final part of the initial trilogy is Xedit. This, like Edit, enlists the help of another hidden utility, namely NewZap. With the aid of this particular utility you'll be able to edit all manner of file sectors and codes all from the comfort of your own home.

NewZap is mainly aimed at the more expert Amiga fan so be careful if you're just dabbling - it could end in tears. The utility's primary use is to examine Ascii and binary within a file whilst searching for those elusive key sequences, digits and characters that are guaranteed to make your hacking life a little easier.

VIEW, READ and XREAD

View, as you might be aware, allows you to examine any standard Amiga image without the hassle of loading an entire paint package to do it. If you have a favourite viewer among the hundreds lurking within the PD it's a simple matter to replace the new for the old and, of course, adjust the relevant line in SID's config file.

The Read option will allow you to examine any Ascii file, which in most cases will mean documents and readme files which you'll find liberally spattered around on almost every disk. If you're reading a big file or one which you want to print, a better option might be to use PPMore which you'll find lurking on the pull downs in the main WorkStation screen.

Xread, like Xedit, is of more use to the expert than the beginner and gives

Paul Austin puts his foot down and explains how to speed up good old SID

Hit the gas and accelerate SID

you the option to read the Hex from any file in a similar way to Xedit, but with Xread you're limited to observation only.

HEAR, MAKEDIR and COMMENT

The Hear option is another automatically triggered utility which will autoload any IFF sound sample and play it at the correct pitch no matter what the sample rate.

If you're not sure as to the identity of a file remember that all can be revealed thanks to the Desk option which can be accessed with a click of the right mouse button at the bottom of SID's custom screen.

Makedir is next and one of the essentials as far as SID's concerned. Things literally couldn't be simpler, just select the disk of your choice and hit the button, add the new directory name and you'll have an instant empty directory ready and waiting.

The Comment option is another essential if your memory is anything like mine. After all, it's very easy to forget crucial information on a particular file and this is where Comment comes into

its own by allowing you to add those few words that can reveal all about a particular file.

Again, to read comments simply click on the Note option after following the same procedure as Desk.

RUN, EXECUTE and OTHER

Run, as you might expect, does exactly that and can be very handy. If, for example, you wish to use a program from a disk which you didn't boot from, simply load the directory, select the file and hit the button.

Execute is very similar to run but of course operates on executable files. If you have a problem deciding whether a file is either runnable or executable use the Desk once again to give you an idea of what you're dealing with.

Other is the last of this particular trio

If you're a newcomer to this column you might be a little puzzled as to what this mystical WorkStation disk is all about. If that's the case it's worth checking out Page 138 for details about what you're missing and how you can get in on the act.

and by far the most interesting. It allows you to define a command of your own to this particular button.

To make use of it first copy the utility of your choice to let's say the C: directory on the WorkStation. Then edit SID's config file giving the Other command the correct path and file name.

COPY, MOVE and DUP

I doubt there's any need to explain Copy as it's sure to be the most well worn button on the screen but Move is often forgotten in the rush.

Move should be almost as heavily used as copy as it is perhaps the most efficient of all the duplication routines.

Dup allows you to automatically rename and duplicate a file onto the same disk. Although this isn't a regular occurrence it can still save a hell of a lot of renaming, copying and deleting when compared to the manual method.

Next month I'll explain the rest of the commands and have a closer look at customising SID's config file. Until next month, bye for now...

Since Spectrum owners first went mad over D'Tronics add-on keyboards to supplement their "dead flesh" rubber keyboards, home computer users have sought to upgrade their machines with bolt-ons and screw-ons. Everyone, from the humblest ZX81 owner with a wobbly ram expansion to the PC owner thirsting for the kudos only a tower casing can bring, has dreamed of transforming their frog into Prince Charming with the kiss of the magic screwdriver.

Amiga 500 owners were a little slow to catch the body-building bug, but their desire for everything from extra memory to a separate keyboard complete with curly cable can now be translated into reality thanks to three distinct upgrade paths. All you need to do is leave about 300 sovs under your pillow for the tin box fairy...

But why? A sensible, level-headed A500 owner confronted by the need to upgrade would quickly conclude that a hard drive, 8 meg of ram, a processor accelerator, and a flicker fixer can all be fitted to his or her machine with little or no external protruberances, so cunning have the peripherals manufacturers become.

Because the sensible, level-headed A500 owner is an entirely mythical

Tin box trio

Does the extra bodywork justify the cost? Stevie Kennedy looks at three A500 upgrade paths

beast, and since cramming more and more silicon inside an already overheated, underpowered case is a road leading eventually to Gurland, more and more Amigans are reaching the conclusion that there's more to upgrading than adding a few spoilers and flashy rubcaps. The A500 is not, after all, a Tardis.

Bearing in mind the needs of the upgrader, the two most pressing criteria on which to judge any offering are the number of new features it adds to the A500, and the number of actual expansion opportunities it offers.

The contenders

There are three realistic upgrade options for those whose ambitions cannot be contained within the A500's flimsy plastic case. The first to appear was A1500 Limited's unit, which I'll refer to as the A1500 shell to avoid confusion, then Commodore launched a very competitively priced A1500 bundle, and now there's the Bodega Bay unit from the States.

They all seek to satisfy the upgrader in different ways, so we'll attempt to highlight their respective strengths and weaknesses in the hope of making your choice a little clearer.

The A1500 Shell

Manufacturer: A1500 Ltd 081-907 3636
Supplier: A1500 Ltd • Price: £235

At first glance, the A1500 shell is the cheapest of the three units. It is also, however, the most basic in terms of features and expansion opportunities.

If purchased on its own, the A1500 shell expansion is just that - a shell. For your money you get an A1000-style system box and a separate keyboard of sturdy metal construction, some ribbon connectors, and a curly cable for the keyboard. There is also a fairly useful manual to guide you through fitting your A500 in its new home, but it is at this point that the A1500 shell starts to show its roots in the enthusiast market.

To get an A500 into the A1500 shell you have to open the machine, thus invalidating your warranty, take the motherboard and keyboard out separately, screw them into the system box and keyboard housing, then re-mount your internal drive on a saddle mount-

ing which is hell itself to adjust. After a lot of messing about with ribbon connectors and a great deal of fiddling with the drive, you'll be the proud new owner of a machine which is cosmetically rather appealing, but which in electronic terms is identical to the A500 you started with.

Major surgery

To be fair to the A1500 shell, it is an enthusiast's option, and its design lends itself more to an open ended upgrade approach. As such it is a unit for those with a definite aim, such as slotting it in a 19in metal rack with the aid of a mounting kit.

The truth is a little hard to swallow, however, as the unit still requires the addition of a DUC daughter board, with one half length slot, before further hardware can be bolted on, or the overdrive box with its two full-length slots which at time of writing is still not available.

As a straightforward re-skin, A1500 shell is a solid and sturdy unit on which even the heaviest monitor can be plunked without risk. The system box is reasonably sleek, if a little rough around the edges, and the finished effect is of a business-like

desktop computer. The keyboard is possibly the A500 shell's weakest feature. As a simple metal box into which the original A500 keyboard construction is fitted without further ceremony, it falls far short of the sort of professional quality keyboards we are accustomed to using on home computers these days. It is certainly a pale shadow of the separate keyboard on a Commodore A2000 or A1500.

If you're a big fan of soldering irons, and need an Amiga casing which will allow you to take a very individual upgrade path, the A1500 shell is a good enthusiast's option.

If, on the other hand, you are an A500 owner requiring an upgrade box which will enable you instantly to access peripherals you would not have been able to use with the original machine, or if you would rather cross a busy road with your eyes closed than go near a screwdriver or soldering iron, this product is not for you.

Bodega Bay

Manufacturer: California Access
(0101) 408 378 0340

Supplier: ZCL Holdings Ltd. Phone

Dave Cheetham on 0543 414817

Price: £299 or £349 with Malibu hard drive controller card

Whatever the Bodega Bay expansion unit is, it is not beautiful. It is, in fact, a hulking great brute of a thing which sits on top of your A500 like a troll on a rock and frowns over the keyboard at you. Not so much an add-on as a squat-on.

In most other respects, the CA-500 is an unusually elegant common-sense solution to the problem of upgrading the Amiga. Quite literally, the California Access people have worked out what A2000 features were left out of the A500, put most of them in a big box, and bolted it on to the side of the 500.

Edge it in

Users who view their warranty as sacrosanct will be pleased to note that the CA-500 doesn't invalidate it. There's no need to open the Amiga to fit the unit because it simply slots into the edge connector on the left-hand side of the machine.

This doesn't mean you'll never have to wield a screwdriver, but it does mean you'll never have to take it to the Amiga. As the CA-500 is complete with all expansion slots and forms a separate bolt-on unit, you'll only ever have to

Pulling muscles with a shell?

► expose the CA-500 to plain view. The basic unit, once added to the A500, comes very close to transforming your Amiga into an A2000. It contains four full-size Zorro II 100 pin slots, three of which are IBM-compatible and therefore capable of accepting a bridge-board, and all of which have removable slots to the rear of the unit allowing for daisy-chained hard drives.

Handy features

In addition, the CA-500 has an integral 200W PSU to power all that extra hardware and its own cooling fan to stave off the onset of meltdown once you've packed an 8Mb ram card, a 210Mb hard drive, and an accelerator into it. These are not just handy little features.

If you're serious about expanding your Amiga, you will certainly need a meatier power supply because the original A500 unit becomes uncomfortable with anything more than an extra half meg and a second floppy. And if you put peripherals in a confined space without a cooling fan you'll soon be

paying regular visits to the Guru.

Another neat design point is the inclusion of an AC output socket, complete with 110V-240V switch, into which your monitor can be plugged. You'll have to fit a three-pin kettle-style connector to the monitor instead of a standard British plug, but the ability to switch your system off and on with a single flick is a bonus which makes it worthwhile.

Drive bays

The basic CA-500 has two front-loading drive bays into which the user can fit 5.25in floppies or, with an optional kit, standard 3.5in drives. There is also a separate mounting area for 3.5in hard

Load your 1500 into the bay

drives, so you needn't use up a drive bay for your hard drive.

The hard drive bay is a blessing as far as CA-500 is concerned.

The four expansion slots are spaced no farther apart

than in the A2000, and as they are arranged horizontally, slotting cards in and out of them is a good deal trickier.

A full height hard drive takes up most of the space available, so the ability to mount the hard drive separately of the controller card without robbing the user of a floppy drive bay is a boon when space is at a premium.

The one notable omission is the video port, essential if you want to fit a flicker fixer or any number of other video peripherals. Although it's true that the A1500 shell is also lacking in

this area, you pay the extra cash for a CA-500 because it promises much greater instant expandability, and to leave out the video port at a time when it is becoming more and more important on the Amiga is a major oversight.

The CA-500 is, overall, a well built and well balanced upgrade system. It may be larger than your average double bed, and almost offensively styled, but it is still the best option for expansion opportunities.

I personally wouldn't pay the £300 asking price, but there are no doubt many aspiring A500 owners who will think the four slots, the fan, and the PSU worth the outlay.

Commodore A1500

Manufacturer: Commodore Business Machines (UK) • Supplier: (Among others) Silica Systems (081) 309 1111 • Price: £699 or £999 with 10845 monitor

The Commodore A1500 is a cheat – it's actually an A2000 with an extra floppy drive and a different sticker on the system box. As a marketing ploy, bundling the machine with a monitor and a selection of software and cutting its price to below that of the 2000 means that A500 owners have an "official" upgrade path which is even more accessible than the trade-in deal Commodore were offering last year.

To take this path, you'd have to sell your A500 and make up the difference, but as a 1Mb A500 with software can usually be sold for £300 second-hand, the cost of an A1500 in cash terms drops to a level close to what you'd pay for one of the two units we've already discussed. As some retailers are offering the A1500 without monitor for £700, you'd be paying £100 more – assuming your A500 went for £300 – for this option than for the Bodega Bay CA-500, and £170 more than for the A1500 shell.

What's in the box?

The excellent software bundle is aimed at the home family user, and includes The Works! Platinum Edition, which is a wordprocessor-spreadsheet-database package, and dPaint III to emphasise the productivity side of the Amiga. For games players, there is Sim City (with terrain editor), Populous (with Promised Lands), Their Finest Hour, and Battle Chess, so it's a games pack designed to appeal to older users – mum and dad – as well as the kids.

It's a poorly disguised A2000, the

mainstay of the serious Amiga market for years, and offers by far the best expansion opportunities of all the upgrades on test. There are two full and

three half-size slots, a coprocessor slot, a video slot, and two IBM-compatible slots. There's room for one 5.25in and two 3.5in floppies, though the 3.5in bays are both full on the official A1500, and the machine has a built-in 170 watt PSU and efficient cooling fan.

The A1500 won't be winning any beauty contests. Its case is a throwback to when PCs were PCs and to make it in a man's world you had to make your statement with sheer bulk. The most vociferous visual statement you'll hear from an A1500 is "I'm a great big fat ugly box!"

The keyboard is probably the

The genuine 1500 from Commodore

A1500's most ergonomic feature. Unlike the A1500 shell, which has a dodgy re-housing for the A500 keyboard, or the CA-500, which retains the

original keyboard completely, the Commodore A1500 has a sleek, separate keyboard. The action of the keys is better than on the A500, if a little chunky for some people's tastes, and the cable is long enough to enable you to use it on your lap.

Peripherals

Unfortunately, you'll be unable to use many A500 peripherals with the A1500. Instead of the male edge connector on the A500 it has female slots on the inside. All peripherals which would normally fit in external ports, such as disk drives and printers, should work with the A1500, but some peripherals have a problem due to the changed layout of the ports.

Rombo's Vidi-Amiga for the A500 is one which won't fit without the aid of an extended ribbon cable because the parallel port on the A1500 is next to the video port and the Vidi-Amiga box clashes with your monitor cable. Problems such as this are rare, but users

should always check for potential incompatibility before shelling out for an upgrade.

On the brighter side, the A1500 will accept any and all A2000 peripherals and cards. As the standard for serious Amiga use until the A3000 takes over – if it ever does! – there are a huge number of peripherals available on the A1500/2000 which A500 users can only dream of using. For example, I doubt very much it, when the Video Toaster finally makes its PAL debut, there will be an A500 version.

Conclusion

The three options are clear enough. If you are a member of the soldering iron brigade and prefer a completely open-ended Amiga re-box, you should go for the A1500 shell. The majority of ordinary Amiga users, though, would be advised to stay well clear of it and settle either for a CA-500 or go the whole hog and flag the A500 in favour of an A1500.

The final decision will come down to cost and the individual needs of the upgrader, but if asked to plump for one option, I'd go for selling my A500 and buying the A1500. It costs a bit more, but the machine is immeasurably better than any number of re-boxed A500s and is sold enough to last for years – even if it is still a big tin box!

Amiga Computer

Henrietta's Book of Spells, from Scotclander's range of educational packs, covers the 7 to 14 age group. I found it to be a really enjoyable way for young brains to be tested.

The story on which the program is based is just as intriguing as playing the games. Henrietta and Henry have been happily married for a whole two weeks. However Henry's inquisitive nature led him to Spellalot, where Morgana the Morbid lives.

Henry was unfortunately turned into a fat frog! You have to help Henrietta restore him to his former good-looking self by completing the five brain-teasing games.

At the end of each game you are given a letter. Once you have completed all five games you have to make a word using the letters you have collected. You must complete the games as quickly as you can - there is a high score table on which you can have your name displayed if you are one of the fastest.

After typing in your name you are asked what size of words you want to try. This means how many letters you would like your words to consist of. You can choose between five and nine letters.

Your spell book is now open, displaying the five games which are Flash, Complete, Crack-it, Hang-up and Jumbles. You choose which game you would like to play first. There are three levels at which each game can be played - easy, medium and hard.

About the games

FLASH: In this one a word is flashed on the screen. You have a few seconds to identify or memorise it before it disappears. You then have to type the word.

If you get it correct, Henry the frog will move one place closer to Henrietta who is standing opposite him. If you answer incorrectly the skeleton will move one place closer to Morgana who is also standing opposite him.

A little warning - one of the skeleton's moves is equal to about four of yours. If you missed what the word flashed was, or need to see how to spell it correctly, press F1 for help.

COMPLETE: The name of the game explains this one. You simply have to complete the word that is on the

screen. If you answer correctly then Henrietta, who is on a skateboard, moves one place closer to Henry. If you answer incorrectly it's one move to the skeleton. If you are stuck and need help, press F1 and you will be given one of the missing letters that are in the word.

CRACK-IT: For this sometimes difficult game you have to crack the code to find out what the word is. There is a clue box which gives you what letters should be changed, for example, this is what may be in the clue box: q-p b-a o-n e-d and b-a. The word in the clue box is "panda". So after looking at the

Flash (above left) lets you see a word briefly, then you have to type it. Capital punishment returns for those who don't get the word quickly enough in Hangman (above).

clue box I have worked out that the letter I should type in is the letter that comes before the code letter in the alphabet. Sounds complicated, but it's OK once you've tried it.

Again, if you answer correctly, it's a move to you. If you answer incorrectly the skeleton moves.

HANG UP: Well we've all played hangman before and that's all there is to this game. But as well as getting the word before the man is drawn, you have to beat Morgana to the top of the ladders.

JUMBLE: In this game you have to unjumble the letters and make a word. If you are right you get to move, but if you are wrong that dreaded skeleton and Morgana will move.

Options

- Sound** Determines whether the various sound effects used throughout the program are on or off.
- Difficulty** Sets general level of question difficulty.
- Clue penalty** Determines the penalty (in seconds) to be added each time the student asks for a clue.
- Sections** Chooses the questions that the program is to ask.
- Record results** Switches on or off the comprehensive results monitoring facility, to record students' progress.
- Size of word list** You can access two lists, either small (up to 50 words for each word size) or large (up to 500 words for each word size). This option determines which will be used.

VScan verdict

I thought I would write in to put the matter straight regarding J Gower's letter in the August issue. Mr Gower complains of not having heard from Arthur Hagen, after sending in his registration "fee" for VScan 4.98c.

Firstly, the registration fee was in fact, and still is, a donation to a children's hospital. None of the money ever went into Mr Hagen's pockets.

Secondly, and most importantly, Arthur Hagen includes the following explanation for his lack of response in the latest version of VScan which is 5.06.

"As my health has failed me, I've spent most of the time since last summer in hospital. This means that I've been unable to answer all letters sent to me regarding VScan. I apologise for this, and trust you to forgive me.

"As I have been unable to answer all letters requesting registered versions of VScan, I've decided to drop the registered version entirely. This means that all functions are now accessible from any copy of VScan, so no registered copy is now needed. I still trust everyone who uses this program to send \$10 or more, which will be forwarded to a hospital for rheumatic children here in Norway.

"Please note that my address has changed. The correct address is now: Arthur Hagen, Skørkeberg Alle 13f, N-1440 DRØBAK, Norway".

Dave Windera, CIX

Pleased to put the record straight Dave. I hope that everyone who is using VScan sends off their charityware donation to Arthur.

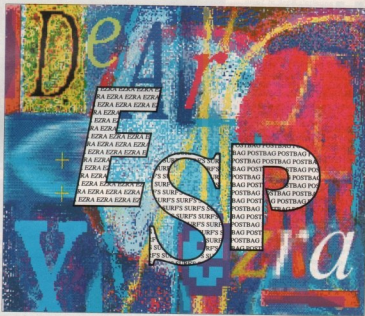

Ripping yarns

I am writing this letter because of some of the contents of your CoverDisk for June 1991. I am referring to those "Superb Samples" in the Samples directory, or more precisely, the "Funky Drummer" sample.

That sample is actually the drum intro to the song "I Am Stretched On Your Grave" from Sinead O'Connor's album "I Do Not Want What I Haven't Got".

Everyone can have their own opinion about using samples from other peoples work in songs (I hate it), but let's keep that debate where it belongs (the court??). The thing of concern here is that your magazine is distributing copyrighted material in the public domain. I realize there are a lot of users out there longing for good samples to use in their music, but I think

PRIZE
LETTER

you should make certain that the samples on the disk are really public domain. Otherwise, I really like the CoverDisk and your magazine, so keep up the good work, but keep the public domain public domain.

Ove Gustavsson, Sweden.

We couldn't get hold of Sinead to find out her views on the matter – she was probably washing her hair.

The debate about sampling does roll on and on, as you rightly point out in your letter. One point I would make though is that *Amiga Computing CoverDisks* are not public domain.

PD pleasure

I would like to take this opportunity to tell everyone what a good service Richard Burman runs. For those who didn't read July's issue, Richard has set up his own PD company, and will copy software on to your disks

for a mere 40 pence! (postage included). Two days after I had sent a blank disk to him his catalogue disk arrived. On it was a list of the 200 or so disks in his library, a classified section for advertisements, a contacts section, three great demos, one amazing game and one of the best virus utilities available!

Secondly I would like to ask if anyone can help me to make a backup of my favourite game (Turrican) using Action Replay Amiga MkII. I can save the initial load-up using the SA command, but I'm not sure how to save the memory loaded up between levels. As I like to save my high scores this game is prone to disaster, and besides I would like to know more about the way the Action Replay Cartridge works.

P Bittis, London.

Glad to hear that you are getting good service from a small operator, true to the spirit of public domain.

We can't really help out with your Action Replay problem. It might be worth remembering that even making backups is against the law according to the copyright act. Take a look at the piracy feature in this issue.

Heart of the machine

What happened to Jolyon Ralph's Assembly Language bit? I know you've got Margaret Stanger to do this as well as the Code Clinic but when I do assembly language coding I do more than open a window.

I'm not complaining about what she does but it's a bit low tech for people like me who have programmed in 68000 for two years and have gone beyond the restrictions of the Amiga Operating System.

What's wrong with a separate section for advanced programmers who can swap ideas and things like that?

Another idea also could be "Best Program Award". This could be judged over a three month period or a year and the best program used on the CoverDisk gets a gold star, big tick and a box of jelly babies for the programmer!

This may bring more programs of a higher stan-

Customer complaint

I wonder if you would let me use your letter column to find out if other Amiga owners have experienced from Commodore the same tardy standard of customer care that I have.

My first Amiga developed a fault within one month of purchase and was replaced without question by the retailer – first class service, no complaints. However, I had already registered the purchase with Commodore and in due course the registration card for the first computer arrived. Since May, repeated letters to seek confirmation that the warranty has been transferred to the second computer have not been answered.

In February of this year I joined the "Commodore Registered Users Club" and paid my dues of £17.95. To date I have not received any communication from this "club" run by Commodore. Again, since May all my letters to Commodore concerning this club have gone unanswered.

Are there any Amiga owners out there who are club members and receive their copy of "Command" newsletter regularly? Or are there lots of people like me who believe Commodore have an appalling customer care service and have ripped them off over the users club?

R A Young, Bedfordshire.

It might not seem like it, but Commodore are actually trying harder these days. I think you will find that their Amiga warranty service and user club are authorised by Commodore but not actually directly operated by them.

If you continue to have problems the best thing to do is go back to your dealer and ask him to contact Commodore on your behalf. I hope it all gets sorted out soon.

dard, only needing a little more effort in some areas to produce the best.

At last nearing the end, I must say I enjoyed reading about DMA in issue 38, and hopefully you have plans to talk to other gaming people.

Duncan Chambers, Tyne and Wear

If you have been metal bashing for two years I am sure that our Machine Code column probably is a bit tame for you. The thing is, Almanac is intended for beginners.

We have been looking into a productivity software award for a little while now – ever since we went to wider pages. Keep watching the magazine for some developments in that area.

I'm glad you enjoyed our DMA Design feature. There will definitely be more of the same to come – Inside Amiga Gamer, which launched this month.

Sound sensation

I am a regular subscriber to Amiga Computing through my local paper shop in Swindon, so as to your card in the back of Amiga Computing August 1991, if I subscribe I could take my pick of either Sound Sensation or two free games.

Therefore as I am subscribing to your magazine for years to come, what chance have I got to get the exclusive personal sound system?

Colin Jackson, Swindon.

To get your personal sound system all you have to do is switch from newsgroup order to direct mail-order subscription. As an additional benefit, you will actually receive the magazine a few days before it goes into the shops.

Thanks for the memory

I would like to talk about things in general in "The World Of The Amiga". Many things are happening that people swiftly pass off but never really understand! For instance, what is Workbench 2 going to be like; why all the fuss about ram and memory?

First off I would like to qualify the amazing stories about internal memory, chip and fast ram and Fatter Agnus.

Inside the Amiga are three custom chips to aid it in animation/ram handling, graphics and sprite control, and sound/peripherals control. These chips are called Agnus, Denise and Paula respectively. These three chips make up the PAD that puts the Amiga above the ST and the like.

The Amiga A500 is now the standard Amiga so we'll

Ezra Surf can be contacted on a whole host of bulletin boards and conferencing systems. If you have anything to say, get it off your chest online!

Amiga Computing now also has its own Fidonet echo which is being carried by BBS systems up and down the country. Any Fido sysops interested in hooking up should contact 01 for Amiga to receive this echo.

Additionally our mail man with the most, Ezra Surf, hangs out on the following services:

Service	Account number
Micronet	999900263
Telecom Gold	74-MK911
CIX	amigacomputing
CompuServe	70007,4734
The Direct Connection	usd1132
01 For Amiga	Amiga Computing

use that as an example: inside the A500 there is 0.5 megabytes of chip ram. This is the only kind of memory that the PAD can use so it is very precious.

The PAD can block out the CPU from using chip ram which can drastically reduce the performance of the Amiga, so to combat this any expansion ram is used as fast ram which the CPU can use. This results in a faster computer overall. In an ideal set-up there should be two times more fast ram than chip ram.

But if you have a 0.5 megabyte internal expansion then that isn't fast ram. Commodore allowed this to be accessed by the PAD but at a much slower rate. For this reason it is called slow ram. It isn't chip ram but the PAD stores some vital information there.

The reason that the PAD can only use chip ram is easily explained. In an Amiga there is fast ram on one side and chip ram on the other; in the middle there is the Agnus chip to keep everything settled. The PAD only has access to the chip ram side while the CPU straddles them both. To expand the amount of chip ram you must expand the Agnus chip.

But why do you need more chip ram? Well, it allows you to multitask more than one program and draw graphics faster, but the most important reason is the advent of Workbench 2.

The new Workbench is double the size of version 1.3. It uses a full 512k. It is stored in read only memory or rom. One law of computing states that a computer functions best with twice as much ram as rom. With Workbench 1.3 this was alright, but to use Workbench 2.0 then you're going to have to buy an internal ram

expansion. To provide the punter with more chip ram, all new Amiga's come with a Fatter Agnus as standard. The manuals don't mention this, but it's there.

Most internal ram expansions now have a chip ram capability that allows the memory to be used as chip ram if you have a Fatter Agnus. You do have to solder three wires to the Amiga but it is very simple.

The Amiga A500 comes with 1Mb standard now, and a Fatter Agnus. Soon someone is going to solder those three little wires in the Commodore production plant and some lucky people will have more chip ram.

Just one point: there are three Agnus chip versions.

Fat Agnus – Old Amiga's come with this, 0.5 Mb chip ram
Fatter Agnus – New Amiga A500's have this, 1Mb chip ram
Fattest Agnus – I don't know anyone with this but it does exist, 2Mb chip ram!!!

So Commodore has just sent the new Workbench to be finalized in a rom chip and rumours rom wild. But has anyone considered how much ram it's going to take up?

Workbench 1.3 knocks off 110k out of ram just by running so you can expect about a third increase in this for starters. That is until you start adding the optional extras such as scalable fonts and hi-res screens as standard. I can see it taking up much more than 150k. We could be taking up to 300k before programs start running!

At least we will know if Commodore have done a good job! How? Well if all those small programs disappear from PD libraries because they've been made redundant then we know it's good. But if loads more start to appear... Roll on Workbench 2.1, or even 3.0!

OK, I'll stop moaning. I love the Amiga to death and some more, and I'm saving up my pennies for Workbench 2, and yes, I have got a ram expansion!

Mark Reynolds, Shropshire.

Ahem... Glad you have got that to lot off your chest. Let no one be in doubt about your views on Amiga memory!

It shouldn't be too long before Workbench 2.1 is available for the Amiga masses. You are right in saying that Commodore have finally got a version of Kickstart that they are masking into rom.

Postal pursuits

Over the past few months in your postbag I have seen several letters about ordering goods by telephone.

To do a bit of comparing, I ordered items from different companies. (I would have done this anyway as it's amazing the differences in price you get if you search through a whole Amiga Computing!)

The best delivery time was by MJC Supplies of Letchworth. I ordered the goods by phone and Connect card on Monday morning at about 10am and received the goods the next day in the post! I ordered from them again and the same happened!

I have found that the average delivery time is about four to five working days.

Mind you it doesn't always run smoothly. I placed a small order with another firm on 6th July as their advert states "Same day despatch".

I decided to ring them this evening (15th July) and they advised me that my goods were still in the despatch depot, as some of their staff were on holiday. During the conversation I mentioned the phrase "Same day despatch" flashed on the top half of their advert but was told that this only applied to orders sent by courier. I looked all over the ad but saw no mention of this! Anyway this hiccup won't put me off ordering by phone and card as the mail order compa-

Sealed off

I have come to a stage with my Amiga 500 that I now need extra memory. As I am interested in making music, I have a growing range of samples and it really sets me back when I cannot load some of them into memory.

Anyway, to the point. I recently saw an advert for ram expansions to fit in the expansion slot on the bottom of the Amiga (1.5 meg in my case), and I was about to send off for it. But first I phoned up Commodore and asked them if it would invalidate my warranty.

They said yes, if you break the seals on the bottom of the computer. But the expansion slot on the bottom of the Amiga doesn't have any seals – or are they hidden? The company who supplied the ram expansion said it doesn't invalidate the warranty, so do

many other companies. Either Commodore or the company are wrong, or have I got confused somewhere along the line? Please help me.

Could you also tell me which Midi synth works best with the Amiga, for around £300? I don't want to invest in a top of the range synth yet as I just want to experiment.

Stuart Green, Birmingham.

You will not invalidate your warranty by fitting a ram expansion in the trapdoor slot. There are no warranty seals, invisible or otherwise.

According to our music maestro, Paul Austin, the best option in your price range to look at is the Roland CM-32L Midi module and a cheap key-board like, for example, the Roland PC-200.

► nies offer the best service, the best range of goods and the best prices.

I have also decided to dive into the PD market after looking through the articles and ads in the magazines and have been impressed by some of the software that I've received and the prices – well what value!

I've decided now to stick with 17-Bit Software as they give you a customer number (unique I think) and that when I tried to order from a library that describes itself as "The fastest, friendliest and most reliable library around" I received the lovely reply, "Huh, we're not taking any orders now!"

I would also like to say that I have bought several Amiga mags but none are half as good as the content of Amiga Computing and the CoverDisk, or have produced such a good idea as the Workstation disk. Keep up the excellent work!

Mark Steele, Dorset.

Credit where it is due on the mail order front. Sorry to hear that one of the companies you trusted with hard earned cash didn't live up to your expectations.

Any readers who have problems with mail order firms who advertise in Amiga Computing should write to our very own Roger Cook – Michelle Allcroft. The address is on page 4 of this issue.

PD libraries do tend to vary enormously in quality and service. And 17-Bit are not unique with membership numbers, but they were certainly one of the first to do it.

The HakPak

I enjoy your magazine. I read it when my Dad has finished with it. I am writing to ask you if you could publish some cheats for New Zealand Story (if any). Also it would be convenient if you publish cheats and maps for Shadow Dancer. I would be very grateful if you could.

Jonathan Whitefield, Milton Keynes.

Look out for lots of cheats to come in our brand new *Gamer* mini-magazine and the *Gamer HakPak* series which started in this very issue of Amiga Computing.

CoverDisk cribbing

I run an Amiga user group which has a public domain library for its members. We charge £1.00 inc. P&P per disk. We are always being asked for copies of your old CoverDisks. Looking in your latest issue (Aug 91) you only have back issue disks from February 91. I have all your CoverDisks (as I always buy Amiga Computing) from August 89.

I would like to formally request permission to provide your CoverDisks as public domain to our mem-

I am writing to you, hoping that you will be able to help me in the matter of obtaining some issues of your magazine.

After buying the September issue "off the shelf", I decided to place a regular order with my local newsagent. When the October issue arrived, however, there was no disk on the cover – the cover had been ripped where the disk had been removed. This was pointed out to the newsagent, who apologised and said he would contact the warehouse and despatch the disk as soon as possible.

A few days later, I was told that the warehouse required the magazine to be returned and a new copy and CoverDisk would be sent out. By this time, I'd been billed for the issue I had, so was a little reluctant to send it back, but I did none the less – after all, I was going to get it back...

I'm still waiting!

Now I have been told that the current issue (June '91) has gone missing. I was then told that as the new issues are coming out, I would not be able to get

bers. The disks format/layout will not be changed in any way. The issues are to be from August 89 to January 91.

I am not trying to make any money out of this, but your disks are always well put together and it seems a shame to deprive new Amiga owners from the excellent programs you have provided in the past. Indeed, it will show our newer members that your magazine is worth buying each month.

D A Shreeve, Norwich.

Thanks for taking the trouble to seek our permission before distributing our CoverDisks to the masses.

As you are no doubt aware, our disks are not public domain. Some of the programs on the disk are PD and shareware, while others are written specifically for Amiga Computing.

We don't really mind our disks appearing in the public domain after a suitable period has elapsed. The hard and fast rule is that we won't complain about our disks being made "public" as long as they are left entirely intact and are only distributed six months after they originally appeared sellotaped to the cover of AC.

Going for a ramble

I, being a mere strapping of a 21 (soon 22) year old, have something of a history in the computer world. (Adopts aged Yorkshire accent, à la Monty Python sketch.)

I can remember when a little black box was all the rage, built by Sir Clive Sinclair, with a touchpad keyboard and a staggering 1k of ram. My brother bought one of these in a rare fit of woefully short lived techno-appreciation, and grew quickly bored of it. Then I got hold of it, and the computer "virus" bit me, and I've been hooked ever since.

I can remember thinking how powerful my little touch-sensitive micro was, with its 16k ram balanced at the back with one part skill and three parts wishful thinking. Leaping into a convenient time machine, we jump forward, brief flitting images of a Spectrum (earth shattering 48k and eight colours!) and a C64 (with two speed disk drive – the speeds being slow and stop. Later replaced with three speed – slow, slower and stop) we arrive at the present day, and a Commodore Amiga 500.

Getting to the point (finally!) I hear you cry, or rather

Back issue blues

hold of the current one and if I saw it, buy it there and then!

This set me thinking that if they can't get me an issue one month old, what hope have I got of receiving my issue from last October?

I hope you will be able to advise me on this matter. I know I can get recent issues from your mail order service, but the list provided only goes back a few months. Are the previous copies still available?

Ian, Tyne & Wear.

Back issues seem to be a real problem I'm afraid. The sad fact is we under estimate the popularity of the magazine in our windswept youthful days and now our back issue cupboards are fairly bare.

Europress Direct always offer back issues for the six months preceding the current issue. If you are looking for anything older you are on your own.

Early copies of Amiga Computing are known to be changing hands for toe-curling sums of money in the Amigaland underground community.

I hear you wall dramatically, loosening the noose and putting the safety catch back on the .45. My old faithful Amiga, bought when everyone eagerly awaited EA's stunning flight sim cum blaster, Interceptor, has seen some upgrading, all done within the same, now battered and stained, case.

First a 512k expansion, then a second drive, a 1084 monitor, an LC-10 colour printer, and more recently, a Kickstart 1.3 and a 68020 processor with 4 megs of liverust ram.

I would like to use your pages to extend congratulations to all concerned over The Secret Of Monkey Island, not only a wildly entertaining adventure and the most fun you can have with a computer, but an adventure that responds to my sense of logic! I find myself cruising through the game, with little to baffle me for too long. More, please.

Sorry for robbing you of much of your letters page, but I have a tendency to ramble uncontrollably, much like my guru, Jean-Michel Jarre, who rambled for 47 minutes on one track of his last album. Ho hum, bye now.

Paul Kerrigan, Coventry.

You ramble uncontrollably and I hack and slash letters with a similar enthusiasm. Somewhere we meet in the middle I guess!

I had a ZX81, then a Spectrum, then an A500 and now a rather beaten up 2000 – and I love them all.

I am sure that US Gold will be delighted that you enjoyed Monkey Island.

Game over?

Over the past few months I have seen Tanx and Rollerpede turn up in PD libraries on a four game collection. Are these the same versions that you had on your CoverDisks and are they really PD?

Jennifer Byrne, London.

Yes and no respectively. We own Tanx and Rollerpede but that hasn't stopped PD libraries from taking them on. As I have said elsewhere, we are not going to get too shy as long as six months passes between the original release and PD distribution.

Where individual programs are taken off our disks, the DOC files must clearly state that the software came from an Amiga Computing disk.

CDTV inside and out

If you've been reading about CDTV recently, you will know that Commodore are going to great pains to convince people that it isn't a computer. You may also know that inside the black box is something not too dissimilar from the Amiga 500 with a compact disc drive bolted on.

So, with screwdriver in hand, I dismantled my CDTV to find out exactly what's inside it, and I discovered a few interesting things.

The first odd thing about the CDTV is that the circuit board is right at the top of the case, with the drives, expansion slots and power supply taking up most of the space below it.

Despite the small size of the unit there is still a considerable amount of free space inside the box – certainly enough to mount an internal hard disk, for example.

Custom interface

The general build quality of the machine is good, there is a nice, large power supply which can quite easily power lots of internal and external peripherals, and a little fan to keep everything cool.

The Panasonic CD-ROM mechanism lives underneath the circuit board and is not, as many people assumed, a SCSI CD-ROM, but has a custom direct interface which was, presumably, much cheaper for Commodore to incorporate. It has a capacity of about 540Mb (that's the same as 700 floppy disks!).

In standard mode it can transfer at 153Kb/sec, which is about average for a CD-ROM drive. The much talked-about burst mode which allows 2Mb/sec data transfer is really not relevant, as a burst transfer only lasts a small fraction of a second, and so the overall data transfer rate is still no higher. Under mode 2 transfers of 170Kb/sec are possible, but to use this the AmigaDOS file system must be abandoned and the data read directly from disc.

Also under the board is what looks like a miniature 3.5in disk drive. On closer examination it reveals itself to be a drive for smart ram-cards, like those found on some portable computers, and on many Midi instruments.

Socket to 'em!

The cards will come in 8Kb, 64Kb, 256Kb and 512Kb sizes, and are to be used for saving data from the CDTV. It appears as a standard Amiga device and can be written to just as if it was a floppy disk. It doesn't in itself give the CDTV any more usable Ram.

The circuit board is not, as was widely rumoured, identical to the Amiga 500. It is a totally new design, and is a lot more complex.

The Amiga 500 has only eight

Jolyon Ralph takes a screwdriver to his CDTV

The CDTV can play music discs as well as software titles

Power on – switch on – bootup – The CDTV front screen

large ICs, the CDTV board has 14 large chips. Several of the small chips are surface mounted.

Surface mount technology is relatively new. It allows even greater densities of components to be placed on a board, but makes repair at the best difficult, if not impossible.

All the major chips are socketed, which makes replacement easy, and there are some old friends, and some new arrivals among the chips on the board.

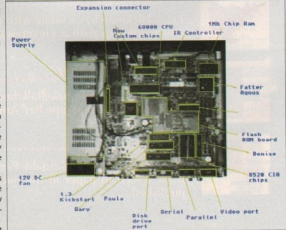

The largest chip on the board is the 68000. It's a straight, 8MHz chip, which is a little disappointing. Many people were expecting at least a

16MHz chip, which costs only a few pounds more yet offers a great performance benefit. In the end Commodore probably decided to stick with the standard 68000 to make Amiga to CDTV conversion a relatively easy and hassle-free process. Easy conversions means more software, more software means more CDTV sales for Commodore, which will benefit all of us in the long run.

The Amiga's custom chips are there too; Fatter, Agnus, Paula, Denise and Gary. The Denise is the original old Denise chip, the new ECS Denise chip doesn't offer many advantages when displayed on a television – which most CDTVs are destined to be connected.

The odd and even CIA chips are there, and these control the disk drive, mouse port, parallel and serial ports. Strangely there is only one mouse/joystick port connected to the back of the machine. If you want to play two-player games then you will either need one person using a wired joystick and the other using the remote control, or you will have to wait for Commodore's infra-red joystick controller, which will control two standard joysticks.

Our old favourite, the Kickstart 1.3 rom is on the board too. It is a plain, unadorned (ie the bugs haven't been fixed) Kickstart 1.3 rom. Commodore have told developers that the CDTV will never

dout

support Kickstart 2.0 again, for compatibility with present "titles".

There are two extra sockets for the CDTV's custom roms. These contain the flashy graphic sequences and all the code needed to drive the CD.

At the moment there is a small daughter-board plugged into these sockets which carries two flash roms (or EEPROMS - Electrically Erasable Programmable Read Only Memory). In fact, rom is a bad word to describe these, as they are fully reprogrammable under software. The idea behind this is that if any major problems are found with the CDTV operating system, it can be upgraded in existing machines just by running a floppy disk in an attached disk drive. Later production machines will have these flash roms replaced by standard rom chips, as soon as the existing code has been declared "bug-free".

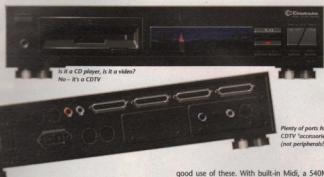

There are three new custom chips thrown in for good measure. These control the CD-ROM, the ram card drive, the front panel and the infra-receiver.

The CDTV has 1Mb of chip memory fitted as standard, there appears to be no obvious way for the machine's memory to be expanded at all. This, from Commodore's point of view, is a good thing, as it means that there will only be one CDTV configuration available, which makes life a lot easier for "title" developers. A CDTV disc is called a title. Commodore don't want people using the word software as they don't want the CDTV thought of as a computer.

Full motion video

There is a spare, unlabelled, expansion socket on the mother-board which appears to pass through the processor bus, in the same way the expansion bus connector on the AS50 does. Although this is not documented anywhere, it would seem that this is where the under-development Full Motion Video (FMV) board will fit in. Currently the CDTV can only display moving video images using Commodore's proprietary CDXL system, which displays 1/4 screen images at 15 frames per second, a little short of the full-screen images at 25 frames a second needed by FMV. Philips and Sony, who produce the rival CD-I system, have announced that their machine will ship with FMV support next year.

The problem with Full Motion Video is with the CD-ROM unit. CD-ROM is not very fast at transferring data. It's faster than floppy drives, but not a lot. A typical Amiga hard drive will transfer somewhere between 500Kb and 1000Kb of data per second from the drive into memory. For a CD-ROM the transfer rate is around 150Kb/sec. Now, a full-screen compressed HAM image will take up about 50Kb, so if you wanted full-screen video from a CD-ROM you would only get three frames per second displayed. For true

full-motion, you need to compress these HAM images down from 50Kb to about 6Kb. Impossible? With a standard CDTV, yes, but with some complex and very powerful custom processors, video images can be compressed down this far and decompressed back in real-time for display with very little loss in picture quality.

External input

Turning our attention briefly away from the insides of the machine and to the back of the case we find an assortment of ports which are familiar to most Amiga users.

Standard parallel, serial, monitor, audio and disk drive ports are connected. The disk drive port is slightly different in that it is wired up so that the first external drive is d10, the second d1: and the third d2:. The CDTV can only support three floppy drives, rather than the four that the Amiga can support, as there is no internal floppy drive and the 23 way connector only has enough lines to operate three drives.

Next to these ports are two small mini-din connectors for keyboard and mouse. It was very disappointing to find that Commodore did not put standard joystick/mouse/keyboard connections on the CDTV, particularly as apart from the shape of the connectors they are totally standard. If you have a CDTV and you want a keyboard connected to it, all you have to do is get an Amiga 2000 (or 3000) keyboard and wire up a DIN to mini-din converter cable using the following pins:

Mini-DIN (CDTV)	DIN (keyboard)
1	4
2	2
3	1
4	5

Underneath these standard ports is the power connector, a standard kettle lead power connector and, for the first time in an Amiga-based machine, Mid-in and out connectors. Already there are titles like Music Maker which can make

good use of these. With built-in Midi, a 540Mb drive and a shape and size that is ideal for work on-stage it would not be surprising to see the CDTV making quite an impact in the music scene over the next couple of years.

To the right of the Midi ports are the two expansion slots. The slots are not very big, the connectors look similar to the type of edge connectors used in Commodore 64 cartridge games, so there won't be a lot of room for complex circuiting on them. The Video slot comes occupied with the modulator. The PAL modulator has RF in and out (You can plug the CDTV in between your video and your TV without having to re-tune everything) and a composite video output. The NTSC modulator also has super-VHS output, but we don't get that yet over here.

There is an optional Scart connector board which gives a Scart plug instead of the modulator. I'd recommend not getting this, but buying a cheap Amiga-Scart lead instead and using the CDTV's 23 way connector. This leaves the CDTV modulator intact so you can use it on a non-Scart TV without having to switch boards over.

Digital Creations in the States, the manufacturers of the highly popular - but NTSC only at the moment DCTV 24-bit graphics add-on for the Amiga have built an internal version of the DCTV (called DCTV-CDTV) which will fit into the video slot. This will then give the CDTV full 24-bit quality graphics, which will help to narrow the technical gap between CDTV and the rival but much more expensive CD-I system.

The other expansion slot, currently empty, is for future CDTV add-ons including a 100Mb Internal hard drive! Don't expect this one for a while though, the current cost of 2.5in 100Mb hard drives is as much as the CDTV itself! No doubt there will soon be a vast array of weird and wonderful third party devices to fit into the CDTV. Now, can you imagine a home use version of the Video Toaster for the CDTV.

The future for the CDTV is going to be an exciting one. Stay tuned...

DP – your flexible friend

It's a common misconception that you need a titling package to produce titles for your videos. Sure, it's nice to have a package that will scroll text around the screen at every conceivable angle, but the fact is that many professional video engineers get on quite nicely with a package that is arguably better suited to artists.

That package is none other than Electronic Arts' Deluxe Paint 3.

Deluxe Paint is a very capable video titling package. It may not have the range of fonts that Broadcast Titler has to offer, but even then it doesn't take much to build up a fairly decent collection – a quick trip to your local PD library is usually all that is needed.

So why is DPaint such a favourite among video producers? The reason is simple enough – despite all the bells and whistles that programs like Broadcast Titler may offer, no other package can match DPaint for its sheer flexibility.

I'm lucky enough to own a fair old selection of video applications including such industry hard hitters as Gold Disk's brand new ShowMaker system, Broadcast Titler 2 and even that old faithful, the Big Alternative Scroller.

You may think that these programs could more than handle the job of video titling, but I still find myself using DPaint more than any other package.

I recently visited a video post production company in Trowbridge, Wiltshire. The company's studio was decked out to the gills with a full range of professional video equipment ranging from Sony U-Matic decks and video mixers to Chromakey and time base correctors.

Sitting in the corner of this power-packed studio was the workhorse of the whole system – an Amiga 2000. Mating the two together was a G2 Systems' broadcast quality genlock.

Like most video production companies these

What's the best video titling package on the Amiga? Jason Holborn reckons it's Deluxe Paint!

days, they too relied almost exclusively on DPaint for the vast majority of their work on the Amiga. A video titling package was also on hand, but this rarely managed to make the journey from hard disk to Amiga memory. This certainly didn't seem to be a financial decision – the firm's two Sierra Cosworth company cars (one of which I took for a spin afterwards!) was more than enough to convince me that they were doing very nicely thank you.

Using DPaint for video titling may create a bit of extra work, but the results are usually better. Obviously DPaint can't handle scrolling too well (although there are ways around this), but there's no better package available for knocking up screens for inclusion within your video productions.

As long as you have a decent collection of fonts, you can produce static screens that cannot be matched in terms of quality. And now, with the release of Deluxe Paint 4, you can even create titles mixed with HAM images.

I'm currently experimenting with Black Belt's 24-bit graphics extender HAM-E, mixing its output with high resolution video titles using Deluxe Paint. The results I've managed to obtain so far are certainly impressive (well, I like them!).

Animation

Being able to mix 24-bit images and high resolution colour fonts with a video source is simply wonderful. I know one thing for sure – my video productions have never looked better.

DPaint's animation facilities are also a real boon to a video enthusiast like myself (especially now that it has a true Lightbox facility). With DPaint, anyone can produce titles and graphics that tumble and turn through 3D space within a matter of minutes. A few years back, such technology would have had the BBC green with envy! The real power of DPaint lies in its painting tools, however. Using DPaint's Smooth tool, it's possible to simulate anti-aliasing like that to be found within Broadcast Titler 2, therefore giving your titles the illusion of being of a much higher resolution.

This works particularly well on monochrome titles (white on black especially), but it's also possible to get colour fonts smoothed out.

Using this technique can be tricky, however. A good bet is to draw a rectangle the same size as the title to be anti-aliased and then pick it up as a brush. Now, with smoothing turned on and the freehand draw tool selected, place the brush over the title and click once on the left mouse button. DPaint will then anti-alias the entire block of text underneath the rectangle.

gle. If the results still aren't as smooth as you'd like, just repeat the process until you're happy.

As you probably already know, a good tip to make your titles as readable as possible once they are laid down onto video tape is to add a border around each character. Black is always the favourite, but it's worth noting the predominant colour of your video source before deciding which colour to use for the border.

You'll notice this technique being used extensively on television, so next time you're watching the news, keep your eyes open for video titling tricks like this.

Add a border

You can add a border to your titles very simply using DPaint's powerful 'Outline' function. To use it, you must first type in the text to be used, then pick it up as a brush, select the border colour to be used and then select 'Outline' from the pull down menu (alternatively, just press 'o' on your keyboard).

DPaint will then add a single pixel border around the outline of the brush. If this proves to be too thin (which is all too common if you're using DPaint in high resolution), then just keep repeating this process until the border reaches the desired thickness.

You can also create simple strobe effects using the Outline tool simply by changing the colour to be used everytime you add a border to the same brush. Using carefully, this can create a quite pleasing effect, but it's also very easy to create some quite garish effects. Be bold and colourful, but don't go overboard!

Thanks to DPaint's powerful brush handling, such effects as extruded titles are incredibly easy to produce. All you have to do is to pick up the text to be extruded, click on the DPaint line tool, position the brush onscreen by pressing the left mouse button (and then press it) and then dragging out the brush to create the extrusion effect.

Obviously the extruded section of the text will be the same colour as the face of the text (which can make it rather unadaptable), but you can get around this either by adding a border to the title (as described above) or by setting the current background colour within the DPaint icon strip to a different colour and then dragging the brush out again, but this time using the right mouse button.

Deluxe Paint may not seem to be the best tool for creating video titles, but if you work at it, some quite astounding results can be achieved.

Indeed, it's possible to produce screens that just wouldn't be possible within a dedicated titling package. You obviously need to have a fairly good working knowledge of DPaint, but then who doesn't?

Titling with DP – as easy as ABC...

This is easier to read than this. I'm sure you know.

Extruded text is very easy to create with DPaint.

A gambling passion

The throw of a dice, the spin of a wheel, or even the selection of a raffle ticket all help to give life some of its excitement.

Using a pseudo random number generator on the Amiga shows that some numbers are more random than others!

In some computer languages it is possible to enter a range, say, 1 to 10, call up a command, and the computer comes up with a random number in the range – just like magic. I looked hopefully in the Amiga libraries for a random number generator, and ended up adapting a routine from a book.

The program on the support disk has random number and timer routines in source module time.a, and the main program in source module digit.a. Both of these are fully commented.

Most computers use a pseudo random number generator, which gives a series of random numbers, starting from an initial number or seed. Each time, the number is modified by a bit of arithmetic so that it will be different next time it is used.

My routine doubles the number each time, and EORs it with a fairly arbitrary constant – it could have been more creative. To give a number in the correct range, the number is divided by the range and the remainder gives the magic number:

```

rander:  pushlong number is in d7
moveb.l d0-d7/a0, (%sp)
cli.w   d6, jleal d6 for return
move.l  d1, d0 ; zero range to d1
tit.w   d1
beq     zer1 ;exit if zero is zero
leal    randerd6, %rthink of d1 = a number
add.l   d0, d6
add.l   d0, d6 ;double it
bbi.s   over
over:    0x1d072b4d, d0
        ;ear it with a constant
move.l  d0, d6 ;save the number
and.l   0xffff, d0
cli.w   d1, d6 ;divide by range
swap    d0 ;save remainder
add.w   d0, d6 ;pretains value in d6
move.l  (%sp), d0-d7/a0
rtd

```

The main program calls the generator twice, once for a digit between 0 and 9, (range 10, offset 0) and once for a colour between 8 and 10 (range 3, offset 8):

```

d7, $select colour
d7, $input number range      move.w #3,d7
    random ;call routine
d6
d6,d6 ;add offset
d6,randint ;save the answer
d7      ;select digit
d7,d7
    random ;call routine
d6      ;no offset
d6,randint ;save the answer

```

```

```

The program can wait for the end of the interval, when the micro seconds count down to zero before the next game cycle starts:

```
_closetimer:    ;close the device
movl  AbsExecBase,%eax
leal  timer_request,%eax
jnr   LVDCloseDevice(%eax)
retl
```

And finally

Remember the random number generator? If the initial number is not "seeded" the sequence of numbers will be the same every time the program is run. By reading the time – at the BEGINNING of the run, before setting the timer – a reasonably unique number of micro seconds can be used to seed the random number.

We have all seen games where the hero has been slowed down when there is a lot of other activity on the screen. It is possible to ensure that each game cycle takes exactly the same time, whether the hero is on his own or surrounded by enemy missiles.

We can set an exact time interval in microseconds, and only continue with the next game cycle when the chosen interval has elapsed.

The software routines for reading and writing the time are not in any of the libraries, but in a timer device. The name device suggests hardware, but it is only a collection of software routines like a library.

When a device is opened, there is an associated parameter block. This structure contains all the structures a device may need to handle incoming and outgoing messages – the structures are nested like Russian dolls.

The message structure includes a node, which keeps the messages placed in a linked list, a message port for replies, and the length of the message in bytes. The message port in turn has its own node, flags, its own signal bit, its task, and a pointer to the header of the task list.

For reading and writing the time, messages are not required, and most of the values and pointers are null. The IO request structure:

```

STRUCTURE IO_MN_SIZE *message
APTR IO_DEVICE      * device node pointer
APTR IO_UNIT        * unit (driver private)
WORD IO_COMMAND     * device command
WORD IO_FLAGS       * special flags
BYTE IO_ERROR       * error or warning code
LABEL IO_SIZE

```

```

STRUCTURE TIMEREQUEST,IO_SIZE
STRUCT      IO_TV_TIME,TV_SIZE
LABEL      IO_TV_SIZE

```

Midi micro please!

Jason Holborn takes a look at what the PD libraries have to offer the MIDI musician on a budget

By its very nature, MIDI has always been a rather expensive hobby to get involved in. With MIDI interfaces costing upwards of £500, you've got to have a fairly friendly bank manager to even get started. Once you've bought all that kit, you still have to buy some decent software.

Thankfully, though, getting together a decent collection of MIDI software needn't cost an arm and a leg. Thanks to the miracle of public domain, there's a wealth of MIDI applications out there just waiting to be used. Here's a run down of a few PD MIDI utilities that I use myself. Check with your local PD supplier for more.

MIDI LIBRARY (Fish #227) – If you fancy yourself as something of a mean coder, then the MIDI library could well be what you've been looking for. Writing MIDI applications from scratch can be a frustrating task, but the MIDI library takes much of the work away, leaving you to concentrate on your application.

The library contains every routine you will ever need to write MIDI applications, without having to get your hands dirty with all the low level nitty gritty. Whether you're coding in BASIC, C, Modula-2 or even assembler, the MIDI library can be directly accessed like any other Amiga library. Programmers should check it out.

ROLAND S220 (Fish #225) – Owners of Roland's rather naff little sampler will love this one. Roland S220 (great name, eh?) allows you to receive and transmit sample dumps to and from the Amiga and the S220 via a MIDI interface. Don't mistake

this for an editor, though – it's really nothing more than a librarian.

ROLAND D110 (Fish #225) – Sound cards for Roland's super little LA synth are jolly expensive (I should know, I used to own one!), so this program comes as a real godsend. Put simply, this program will allow you to transmit and receive patch data from the Roland and store the resulting files on standard Amiga disks (which are considerably cheaper than ROM cards!).

MIDI TOOLS (Fish #159) – Someone may find this collection of tools useful. It's basically a collection of miscellaneous MIDI utilities to carry out such tasks as creating MIDI echo (which is handy if you don't own an effects unit), storing System Exclusive data (SysEx data) and there's even a neat little on-screen keyboard which allows you to play notes on your MIDI keyboard by clicking with the mouse on the onscreen keys.

DX-SYNTH (Fish #82) – Yet another patch librarian, but this time it's for the Yamaha DX range of synths (DX7, 21, 100 etc). Just like the Roland D110 program, DX-Synth allows you to store patch data on inexpensive Amiga disks.

PANL (Fish #82) – I couldn't quite get this to work too well, so buy it at your peril. It claims to be a universal MIDI parameter controller, but I certainly couldn't get it to work beyond a few basic functions. If you're prepared to persevere though, you may well find it to be a real gem of a program.

SAMPLEWRENCH (Fish #307) – Owners of 12 and 16-bit samplers will flip at this goodie. It's not quite a fully working program, but instead it's

a demo of a commercial product from the US-based company Dissidents. I had a play with the full program a few months back and was thoroughly impressed, so this demo is definitely worth getting hold of.

Sample Wrench is designed to allow owners of MIDI samplers that support the MIDI sample dump standard to edit and store 12 and 16-bit samples on the Amiga. Just like AudioMaster III, Sample Wrench displays your samples in graphical format allowing you to cut, paste and copy to your heart's content.

One very nice feature of the Sample Wrench program is that it allows you to preview your samples using the Amiga's internal sound hardware, therefore avoiding the time it takes to dump back to the sampler. As we all know, MIDI can be terribly slow at times, so this feature is a

SampleWrench: thoroughly impressive demo

real time saver. Obviously the sound quality doesn't quite match that of a Synclavier, but it's a nice feature none the less.

It offers powerful Fast Fourier Transformation, digital equalization, crossfade looping (just like the Emu EMAX!) and a lot more besides. If you own a pro sampler, then beg, borrow or steal a copy of this program now.

CZ EDITOR (Fish #323) – Here's a real demonstration of the quality and value for money of PD software. Patch editors cost around £100, but this one can be yours for the price of a disk.

As the name suggests, the CZ Editor is a complete patch editor for the Casio CZ range of synthesizers including the CZ-101, CZ1000, 2000 and 3000. Like all good patch editors, CZ Editor can display your CZ synth patches in graphical form, allowing you to alter parameters by pointing and clicking on gadgets and dragging out points on an ADSR (Attack, Delay, Sustain, Release) graph. If you've got a CZ synth, then you'd be a fool to miss out on this one.

K1 EDITOR (Fish #332) – Casio owners aren't the only ones who are in for a treat within the PD libraries. If you're the proud owner of a Kawai K1 (or K1m) synth, then Fish disk #332 should be at the top of your shopping list.

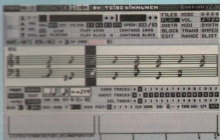

Once again, the K1 editor offers everything you'll probably ever need to allow you to create the kind of killer synth patches that would have Jean Michel Jarre green with envy. The package consists of two programs – one for multi voices and another for single voices. A separate voice filter program allows you to maintain a number of synth banks without ever having to look at your Kawai's eye-straining LCD strip. Check it out.

Octamed Upgraded

It's only been available for a couple of months now, but already Teijo Kinnunen has come up with a major upgrade to his well respected Octamed program. Like its earlier cousin, you can buy it from Amiga Nuts United for the terribly low price of just £10.

As you can see from the picture below on this page, the major new addition to Octamed version 2 is score editing, which is sure to prove very popular with traditionalist musos. No longer do you have to type in all those unhelpful letters and numbers – you can now enter performance data using those funny little squiggles that people like Mozart and Bach seemed to get on with so well. Joking aside, this feature alone should make composing tunes on the Amiga so much easier for those among you not familiar with Bar and MIDI stream editors.

I'll be bringing you a full review of Octamed version 2 in the next issue of Amiga Computing (hopefully!), so stay tuned for that one (no pun intended). Meanwhile, give Ray at AmigaNuts a call to find out more.

PRICE BREAKTHROUGH!**

**There's an
electronic
Aladdin's
Cave of
shareware
and PD
programs
... just
waiting to
be explored!**

Due to the tremendously high demand, the price of the acclaimed EuroLink modem has been reduced to £149 – a reduction of £80 on the previously advertised price of £229.

This means it is now even better value – still with the same full specification and all the advanced features of more expensive modems.

It is the easy-to-use key to the ever-widening world of communications. Simply connect it to your computer and your telephone and you're ready to go.

With your EuroLink modem you can access leading information services such as the UK's Prestel, Micronet and Telecom Gold, the legendary CIX, and the world-beating CompuServe, the biggest online database and information service of them all.

Use the EuroLink modem as your own complete communications centre – to send fax, telex and electronic mail messages, keep up to the minute with the latest news, sport,

weather and financial markets, or even roam the world searching and retrieving data from the leading electronic libraries.

Or you can simply explore some of the many hundreds of amateur bulletin boards all over Britain where people with the same computer as yourself, and with similar interests, help each other with practical ideas and advice that you wouldn't be able to find any other way.

And CompuServe comes free!

With your EuroLink modem comes FREE membership of the world's biggest online information service, CompuServe. You'll get your own personal ID number and password, the ideas-packed CompuServe magazine, and \$15 of FREE usage credit.

One of the many attractions of CompuServe is its vast library of nearly 30,000 shareware and PD programs you can download directly into your own computer.

And CompuServe, plus your EuroLink modem, also turns your computer into a 24-hour, seven-days-a-week fax and telex machine!

Online access...

If you are a regular reader of *Amiga Computing* you will not doubt be aware that we can be contacted on a whole range of BBS and conferencing systems.

We are probably one of the most accessible magazines around, partly because we do value reader feedback and partly because we like to practise what we preach in the comms community.

We get an encouraging amount of feedback online from comms equipped readers. The bulk of response originates from the Amiga Computing Fidonet echo, which is available virtually country-wide at local call rate. We are also present on a number of public and private systems which are listed later in this article.

Beware of imitations

Recently, it has come to our attention that some "enterprising individuals" are passing themselves off as us, using the account name *Amiga Computing*. It has been said that imitation is the sincerest form of flattery but in this instance it is nothing more than cruel deception.

Because of the numerous hoax accounts that are in existence, it is with regret that *Amiga Computing* will be sticking to a core of only six key services, rather than calling smaller boards ad-hoc as we would prefer.

It's not all bad news though – the services we are on make us accessible to the entire country and most of Europe and the USA at only local call rate.

The rundown

From now on *Amiga Computing* can be contacted ONLY on the following online services:

01 For Amiga: (BBS) [8/N/1] Scrolling – 24 hours
The home board for *Amiga Computing*. Our Fidonet echo originates from 01 for Amiga. Get to it by selecting message area 4.

Only messages on the echo which originate from this board are really from the *Amiga Computing* team.

Micronet: (subscription service)

Everyone can access Micronet at local call rate. It is a popular viewpoint comms service featuring pages of information, software to download and a selection of multi-user games. *Amiga Computing* can be contacted on account number 999900263.

Micronet monthly

Art Purvis takes a stroll through the Micronet gallery

One of the most famous areas on Micronet is the 'Gallery'. Not a collection of fine art, as you may think, but a series of "exhibits" provided by ordinary Micronetters.

Anyone can have a space of their own in the gallery – naturally you have to be legal, decent and honest or you'll incur the wrath of Micronet and your exhibit will be deleted. Having lost 3 exhibits of my own this way, you can take my word for it!

The users who can control themselves can find the running of a gallery exhibit to be very rewarding – for little more than £2, you can own 26 pages of your own within the Gallery, and place on them what you want.

What do people put in their exhibits? Almost anything you can think of. Long-running exhibits in the gallery have been 'Joystick', a neat mixture of games news and tips for all machines. Another favourite is the 'Astra Preview' gallery.

The Micronet Gallery – potentially your shop window to 18,000 people

CIX: (subscription service)

CIX is one of the biggest private conferencing systems in the world. It features comprehensive messaging and a wide range of specialist conferences. You can get in touch with us by either mailing *amigacomputing* or writing a message in the Ezra conference.

The Direct Connection: (subscription service)

A newish rival for CIX featuring Usenet links and a fairly restricted, but interesting, range of conferences. You can pin us down on TDC by mailing account number: uad11132.

Telecom Gold: (subscription service)

The die-hard of business communications. *Amiga Computing* can be contacted on Gold account number: 74-MIK911. Be warned – we don't make a habit of logging onto Gold any more than we

giving those all-important details about Satellite TV on a month to month basis. Once rivalled by "Square Eyes", the gallery for BSB viewers, but now without competition, it's one of the most popular exhibits with 'netters.

Declared interest

Moving into the more diverse, there are exhibits about gardening, kit cars, witchcraft, train spotting, and naturally a plethora of galleries centred around Micronet's play-by-electronic-mail RPG game "Starnet".

Sadly, some exhibitors lose interest very quickly, and there are numerous exhibits that haven't been updated for months – an even larger number remain empty. If nothing else, it makes the worthwhile exhibits easier to spot!

There's no doubt that the facility to put up your own material on Micronet for anyone else to see (and remember we're talking about 18,000 people here!) is cheap at the price.

Certainly, the Gallery is THE starting block for micronetters looking for fame and recognition. Many 'netters became known through their galleries, and indeed some exhibitors went on to working FOR Micronet, such was the quality of what they could do.

When it comes down to it, you'd be hard put to find an area on any online system quite so diverse as the Gallery!

absolutely have to, so you might have to wait a while for a reply!

Compuserve: (subscription service)

The world's biggest communications service. Probably the easiest way for our USA readers to get in touch: *Amiga Computing* can be contacted on ID: 70007,4734.

The printed word

There is a world beyond the screen and the layout grid and the toolbox and the crashes, you know, and for the DTP user one of the most important people in this wider world is the printer.

We're talking here not about the kind of printer with pins or cartridges, but the kind with eyes, ears, and – most importantly – a wallet.

Consider three factors before having a DTP publication printed. (I refuse to say 'printed up'; it's as bad as 'written up' and 'booted up' when just the verb would do.)

First, does it need professional printing? Second, can you afford it? And third, if the answer to the previous two questions is 'yes', what can you do to make the printer's life easier?

Professional printing is not, as some printers would naturally prefer you to believe, a sine qua non of a professional-looking document. If you're only running text, and it's not at too small a size, photocopies of 300dpi laser output will convince just about everyone except the typography bores, and nothing ever pleases them anyway. Make sure the laser printer and photocopier have fresh toner, keep your head straight about what should be on the back of what, and away you go.

It's also worth bearing in mind here that the best printing cannot save a poor original. If you're outputting 3D illustrations on a nine-pin dot-matrix printer, which I can't believe any reader of *Amiga Computing* would be so crazy as to do, the results are going to be disastrous anyway and there's no point in spending money on them.

That raises question two. The good news here is that printing is not necessarily as expensive as commonly believed; and if you're expecting to make money from the publication by sales, sub-

Barnaby Page concentrates on getting publications from your screen to the printing press...

Plenty of printers to choose from

scriptions or advertising, the investment in a good-looking result can repay itself.

You just have to find the right printer (on a 96-page A5 book with a print run in the 1,000-2,000 area, I've recently been quoted a pleasing 75p per book – but I'm not saying who by!).

First of all, don't have any truck with the mail-order people who do postcards, business cards and the like. They're mostly competent, but they're not particularly cheap, you have no control over what happens on the other side of the country, and for large publications the postage costs stack up.

Stay local

Try to avoid the high-street quick-print chains. They're fine for stationery, and are not used to out-of-the-ordinary jobs.

Far better is to try a small local printer, the kind with one press, three or four staff and a pleasantly dishevelled atmosphere. As in any business, there are some cowboys, but there are also plenty of these printers who take a real interest and pride in their work. More cynically, they're also desperate for work in the recession, and will often take on a job at cost just to have their staff and presses doing something.

It is quite acceptable to ask several printers for a quote on the same job, and to haggle afterwards. However, attitude should count for as much as the quoted cost: a pleasant printer will quite likely throw in some small extra work for free, such as stripping in your last-minute text corrections, whereas he who quotes low could add on a hefty fee for this.

And for the same reason, don't try to bargain the printer down to the last penny, or he (sadly,

in printing even now it's usually a he) will be unlikely to show any generosity in return.

Be as precise as possible when asking for a quote. You'll need to state the page size; the number of pages in the publication; how many copies you want printed; and whether you use colour, and if so how many colours and on how many pages.

Then there's the kind of paper you want; whether you want a separately-printed cover, or whether the cover will be the same as the rest (a 'self-cover' publication); how you want it stapled or bound; and what you will give the printer (an Amiga disk – inadvisable! – laserprint, bromide paper or film, with or without pictures).

Be decisive

If in doubt, ask the printer what he needs to know. Don't get fobbed off with jargon – you have a right to be told what 'right-reading positives in imposed order' are, and how much they affect the quote.

That's sort of answered the third question, as well. To help the printer, always give him as much information as possible, and expect him to behave the same way toward you. Remember that his job is to put ink on paper, and he may not understand what you're trying to achieve creatively, so it's best that he not be left to make any decisions other than the purely technical ones.

Finally, a caution. You will encounter some printers who distrust DTP (whether it's a distrust born of envy we'll leave the psychiatrists to decide).

Don't go near them – they might be wonderful craftsmen, but you can bet that if anything goes wrong with the job it's your DTP system that will be blamed. And that's a real cheek when we all know that the Amiga is perfect...isn't it?

Barnaby Page is editor of *PrePress* magazine and a DTP consultant. He can be reached on CIX as 'prepress'.

New version of AmigaTeX

The latest release of the AmigaTeX typesetting language is now available in the UK and Eire.

Version 3.1a of the five-year-old system adds full PostScript support – including both Type 1 and Type 3 fonts – and compatibility with AmigaDOS 2.0, say distributors Industrial Might and Logic (IML) of Brighton.

The new AmigaTeX is a fully-fledged implementation of the TeX 3.1 standard, particularly suitable for scientific and technical Amiga users with its equation and table features.

It costs £140, which IML claims is cheaper than ordering direct from the US. Contact Paul Ockenden at IML on (0273) 621393, or write – don't phone – to IML, 58 Cobden Road, Brighton BN2 2TJ for a free working demo.

The WORKSTATION is here!

Price only
£3.50

It's no secret that the Amiga is the most powerful home computer of them all. What has remained a mystery for most newcomers is how to make the most of its immense potential. Now **Amiga Computing** has produced a floppy disk that is packed with everything you need to take the hassle out of harnessing the inbuilt power of your Amiga.

Many months of research and testing have resulted in a simple-to-use, single disk replacement for Commodore's Workbench which we're calling The WorkStation. This indispensable collection of utilities, including some outstanding shareware never before assembled together on one disk, is now available for just £3.50.

It's too good to miss!

The ability to design custom fonts is standard in the Amiga's disk. The virtually unique to computers in the Amiga's disk. The WorkStation turns your Amiga into a comprehensive design studio, providing a wide range of graphic tools that can make even creation child's play.

Got a faulty floppy? When vital disks get damaged, you'll now have the chance to try the seemingly impossible mission of recovering all your work. Workbench's geriatric DiskDoctor can be sent into retirement by this super utility!

Heart of The WorkStation is a powerful shareware package called SID. When you use it you can say goodbye to tedious blank screens and complex commands. Instead your mouse takes full control. Fiddle with files, display text and graphics, sample sounds, uncrunch archives... all this and more with just a click of a mouse button.

The WorkStation has a fully configured dynamic recoverable ram drive which acts like an extra invisible drive to your Amiga. It's a vast improvement on the standard Amiga drive because it is very flexible and goes easy on memory.

Aspiring artists: Here's the package you've been waiting for! Using nothing more than your trusty mouse you can now screen that runs under Workbench. Grab screens from your favourite PD game and 'edit' those high scores using any popular paint package.

Putting print to paper? The WorkStation disk includes a superb text editor. This powerful package has an unusually no-fills approach to producing and formatting professional looking text that would be envied by many of the more expensive commercial products.

To start off this month let's take a look at some games.

Scum Haters: from Amiganuts has been written using the Shoot-'Em-Up Construction Kit. Just saying that should let you know what's in store for you.

The basic scenario is that the streets of your city are being overrun with the kind of scum that would make even the Kray twins think twice about entering a life of crime, they are that 'ard.

Guess who has taken it upon himself to clear the streets? Yep, you guessed it - you. Just like the mug you are, you have volunteered for this dirt clearing mission.

You drive your car up a vertically scrolling road blasting other cars who are busy firing back at you. There are some not so innocent pedestrians walking the streets lobbing bottles at you. Just run these over to get rid of them - simple.

This may all sound a lot of fun but Scum Haters suffers from the same problems evident in many games written with the SEUCK - a distinct lack of speed. Still, it's fun for a little while.

China Challenge - Scope 109: This game by now should need absolutely no introduction. No chance of extreme amounts of violence and blasting here, just a nice quiet strategy think-'em-up to keep you busy for a while.

Shanghai surprise

You have to pair up stones with certain symbols and numbers on them to remove them from the pile. The object is to remove them all before you run out of possible moves to make.

The game is very relaxing and the graphics are fairly detailed. This is a decent Shanghai game and it should grace your PD collection soon.

Black Jack Tutor & Solitaire - Scope 131: For anyone who would love to play Black Jack in the evenings, or

Nice title screen - almost starts to build your hopes up, doesn't it?

Lift eh, SEUCK alert, slow game, very little action. Still, it could be worse, I think

PUBLIC SECTOR

If it's cheap - or preferably free - Les Ellis is your man. He'll take you through what's hot and what's not on the Amiga PD scene

those who have a Black Jack set and haven't got a clue how to play, Scope 131 is the disk for you. It has a very good tutor that will take you from a complete novice to an accomplished Black Jack player in a short while.

The solitaire game is an excellent

way to while away those long winter evenings. The graphics ain't exactly Cinemaware standard but who wants that in a card game? Good fun is ensured with this package.

Galadria: This is a shoot-'em-up extravaganza from Public Dominator, or rather it would be if it wasn't written using the SEUCK. Although saying that,

the sounds used in this really are something else.

Turn the volume right up, close your eyes and imagine you are in an arcade somewhere. I kid you not, they really are that good.

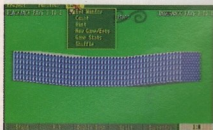

The basics are, well, basic. You fly a ship up a vertically scrolling screen blowing the hell out of anything that

NBS DISK G174

This is a five-game compilation featuring some of the best games on Amiga PD. The first is Tame, the classic two player tank battle where you and your opponent are on opposite sides of a range of hills and have to try to blow each other up. Then there's Boulderdash, as featured on the CoverDisk a couple of months ago, and Avalon, a - wait for it - three player Tetris game.

One of the best on the compilation is Amigoids. No, it isn't some kind of new haemorrhoid problem, it is in fact a replica of the cult Asteroids game.

This one features a unique double ship feature that really does distinguish from the rest. Cave Runner is the Boulderdash clone, not quite the same graphically but a lot of fun nevertheless.

Five decent games for the price of a disk - what value

Another SEUCK game, not exactly Pygmalion graphics but the sound effects are brilliant

► moves. And if it doesn't move, well blow the hell out of it anyway just to make sure.

Bug Bash: This is one of the latest offerings from Amiganuts. The name is similar to a budget game that was released a while back but I haven't seen it so I don't know whether it is the same or not.

Great graphics

The graphics are very bright and colourful – I get the feeling that kids will love this one. You control a bug as he flies through fields blasting other bugs with his bug blasting spray. Like I said, good graphics and a very professional looking piece of software.

Cross Words: If blasting aliens isn't exactly your idea of fun then a gentle crossword may be more your cup of tea. If this is the case then you could do a lot worse than try out the two-disk offering from those crazy Amiganuts.

These disks contain some devilishly tricky crossword clues that are extremely easy to use, but not so easy to complete. Amiganuts also say that they will be offering more disks each month to keep the collection fresh.

The puzzles are very well presented onscreen and are certainly a thought provoking way of wasting a few hours.

Cute graphics, neat gameplay. A professional looking game all round is Bug Bash

Utilities

- Now for some nifty little utilities that may be just what you are looking for.
- Remember the general rule, no matter how small or trivial something may seem, if you need to do it on your Amiga there is probably something somewhere on the public domain market that will do it for you.

MessyDos

- First up is the long awaited working version of MessyDos. Sounds silly? Well, basically it's exactly identical to SID – in

If you need to do it on your Amiga there is probably something somewhere on the PD market

fact it is SID. The main difference in this version is that MessyDos will read PC disks.

So if you handle a lot of PC disks in your Amiga work and you don't like using CrossDos or any utilities like that then MessyDos is for you. One very useful feature I found is that by clicking on the Shrink command you can have SID installed on your workbench screen so that just by clicking on its bar at the top of the screen you can call it up anytime – ah, the true wonders of multi tasking.

I say that MessyDos is long awaited, but this is not strictly true – after all it has been around in one form or

another for quite a while, but these versions had one minor problem, they didn't exactly work very well.

You can rest assured that this version works perfectly. It's an essential addition to anybody's hard drive.

Zip that virus

Virus killers are widespread nowadays. It seems that it is not safe to use an Amiga without having some form of virus killer handy just in case.

Although there are a few golden rules to follow to avoid infection, every-

The master virus killer in action – zap that virus once and for all

one will have to face up to one sooner or later. The latest from Amiganuts is MVK 2.2. A match for almost any virus that may try to invade your disks, it is very easy to use (which is good news for any novice users) and very effective.

For anyone using a hard drive, especially the AS90, VirusX 4.1 is an absolute must. VirusX 4 kept crashing the system whenever you tried to run it as a background task on the AS90 but version 4.1 has that particular quirk fixed.

Scope

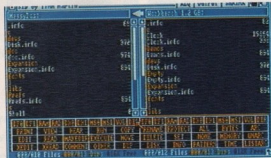

Softville have just started a collection of disks that they hope will eventually rival the Fred Fishs and TBAGs of this world.

Called simply Scope, each month they have up to date utilities and some cute games to mess around with. Let's take a look through a couple of these new disks to see what they are all about.

Scope 121 for example has a stock market management program that will handle all sorts of stocks and shares and perform analysis on them. It has loads of features and may well be of use to you if you have taken part in any of the recent privatisation offers, or maybe

Nearly done this crossword – well actually that's a lie, I'm stuck on 17 down

At last, a version of MessyDos that works properly. Now that's what I call a useful utility

Just what you've always wanted, an Atari ST emulator on your Amiga. Great?

▶ you are in a company share scheme or something like that.

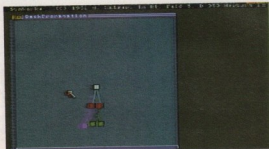

On Scope 131 there is a quick little loan calculator – just bash in the figures and it can tell you (or print out) monthly repayments or how many months it will take you to pay off a loan. Scope 131 also has the obligatory (or so it seems) disk info program that will tell you just what you have mounted and how much room is available on each.

It's just your run of the mill info routine but if you don't already have one they do come in useful. There are some other utilities on Scope 131 but there just isn't room to go into them all.

Scope 149 has a far more interesting utility on it. Beat this – an Atari ST emulator. Quite why any self respecting Amiga owner would want one of these is beyond me. Obviously you can't

expect something like this to run any ST games although it does have a brave attempt.

It did manage to get an ST spreadsheet program to run on it so it will run

Anyone want to learn about neural networks? Well, Fred Fish can help you out there

some things. It is also rumoured to run the Atari PC software emulator, although I didn't have a copy of this lying around so I couldn't test it out.

Even if you can't get anything to run on it, it's still fun getting the ST boot-up screen on your Amiga to amaze and probably confuse your friends who may have Amigas.

Scope 149 also has a useful font manager program that will put up a requester showing what fonts are available in your system with an example of each. To finish off it also has some new fonts and pagestream printer drivers for you. Well I did say that however irrelevant something may seem to you, someone may want it.

We seem to keep coming back to the Scope collection but there are a couple of good reasons for this – a. is that Softville sent me absolutely stacks

of Scope disks (it took an entire Saturday morning to go through them all) and b. is that they are all packed with loads of goodies. Get in touch with Softville for the full list.

On disk 104 there are loads of utilities. Quickhelp lets you make your own helpfiles for your software. These files use the help key for access.

Fixicons is a utility that will allow you to change the type of any icon with ease. MuchMore is the file reader that is very commonly available now.

ProDialer is an Amiga phonebook that allows you to store loads of numbers and relevant details. When hooked up to a modem it will also dial the numbers for you. It is compatible with tone dialling so if your fingers are getting tired with looking up and dialling loads of numbers let your mouse do the walking.

CPopy is a disk copier that can recover files from bad disks, and indeed may be able to save the disks themselves. There are a couple of sounds on it as well – a laugh and a groan. I think these were just put on to fill up the disk as they are of no use whatsoever.

The Address book utility allows you to store names, addresses and any relevant information on people. It will also print out labels, so you can jazz up those normally boring envelopes when you write to your friends. There is also some music from European demos, three tunes in all. Actually they sound quite good.

AnyMonth is a handy utility that will

Panorama 67A

This is the first time I have come across this disk and it seems to be one of the better available, being crammed with good utilities that anyone can use and some good games.

This disk features a game that very nearly got released at full price. Unfortunately Blockout appeared before it could be finished so it has been released onto the public domain instead.

Cubus is a 3D Tetris style game. It features a standing column down which various 3D shapes fall. You have to position them to utilise the space available. When you cover an entire level the blocks vanish giv-

ing you more room. The graphics are nothing special but do the job adequately.

The controls can be a real pain at first. Using the numeric keys to rotate the shapes is a pain in the ass to put it lightly. Still, a fair amount of satisfaction is had from getting the hang of them and eventually clearing the shapes. A good game but Blockout is a lot better.

On the Utilities side of things disk 67A contains ClickDOS II v2.0. ClickDOS is an excellent directory utility that allows the management of files on your disks without having to use the CLI. It requires the arp

library to be in your workbench but other than that it is pretty self-explanatory when running. I should think newcomers to the Amiga may be interested in using this as opposed to CLI.

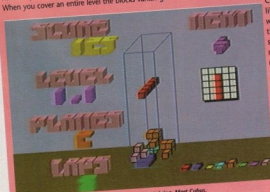

DirWork is a highly configurable directory utility. It has many features that other directory utilities may not have. For a start it has a built in virus checker, key macros, a screen blanker and all the file manipu-

lation tools you will need. This version is v1.30 and is the latest version available.

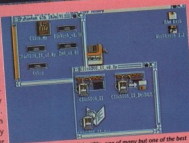

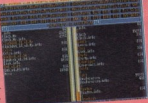

The final utility on this disk is DMS v1.03. DMS stands for Disk Master and it is a utility that allows you to compress and archive floppy disks. It runs from CLI and needs 512K so if you don't have a meg

you will need to disconnect that extra disk drive.

DirWork is the latest in a seemingly never ending line of disk utilities. You really are spoilt for choice.

3D Tetris, likely to be one of the most entertaining. Meet Cubus.

ClickDOS 2 is another MacDisk utility, one of many but one of the best

► put a calendar for any month of any year on your screen. This is obviously going to be useful for any advance planning you may want to do.

Finally, it finishes with Monitor1.24, a machine language monitor for debugging programs. This one's for extremely techy buffs only.

Fred Fish

The latest Fred Fish offering is a little laid back for once – no hacks, no thrills, just good, honest useless utilities. Firstly it has a program to copy files from the PC side of an Amiga fitted with a PC-AT bridgeboard to the Amiga side using wildcards.

Now is that useful or what? I guess it might be if you had an Amiga fitted with a PC-AT bridgeboard.

Then it has a program that allows the design of, and training on, neural networks (whatever the hell they are). It's supposed to be the latest thing in computers but I don't know anything else about it. You'll have to read the documentation.

To end up there is VNRK version 1, a new breed of virus killer. Personally I don't think you can beat VNRK2.2 or VirusX 4.1. But then I always was a traditionalist.

UTIL113: This latest offering from Softville is packed with loads of test utilities. Basically this is the disk to get if you want to get just about anything

The Insider's Club 17 Bit Software Disk No 1166

This is a very in-depth, but fun, look at the cut-throat world of the stock market. You control a company whose business is buying other people's businesses.

The game is based on the Aussie stock market rather than our own. Up to two players can play at the same time and they must compete to anticipate effects of certain events on the share prices of other companies.

Then you can blow your money buying them up. There are loads of options that make the game a lot of fun.

How could go for a bit of insider dealing – it's very dodgy and costs a lot but the results can be very worthwhile. Try buying all

Time to play Wall Street for real with The Insider's Club from 17 Bit Software

the remaining equity in a company that the other player was saving up to buy. Talk about the ultimate in frustration. If you prefer it, the computer can control the opposition.

This game may seem strange at first but when you have read the document file it all makes sense. It is an in-depth game so it is just as well there is a save game feature in there.

There's plenty of room to save games out on the same disk that it comes on, although I would suggest copying the game off onto a spare disk.

I'd recommend this game to anyone who feels they could handle a hard night's share dealing after a long day at the office. A corker of a game.

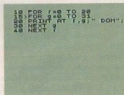

with your text. If I seem a bit brief in the description of the other stuff is because the star feature on this disk in my opinion is the ZX emulator – yep, that's right, turn your half meg Amiga into a mighty Speccy.

I don't know if there is a way to get Spectrum software to run on this but I wouldn't bet on it. It does however allow Basic programs to be written on it.

Once you work out all the symbol shift keys and stuff like that you can

have a lot of fun. A couple of problems with it is that it runs about eight times slower than the Spectrum (is that possible?), also the sound commands didn't seem to work and the use of colour had some adverse effects.

Still it does take you back to the old days of computing. I just can't figure out why anyone would want to do this on the Amiga, and what on Earth made someone actually write the damned program. It takes all sorts I suppose.

Try out this little program. I'm assured by our resident ZX programmer that it will display extremely hi-res, Pygmalion-style graphics. I think he may have been lying

This month's star demo, Virtual Worlds, showing the best 3D resolution and then some

Demos

This month I have been absolutely snowed under by demos so let's not waste any more time and get straight down to them.

Virtual Worlds

First up on the demo front this month is Virtual Worlds. It starts off with the very nice, but very boring, rotating 3D shapes. Come on guys, how about

something different? We've seen it all before.

Mind you, after the boring bit there is a nice routine in 3D with a rotating plane flying around leaving the credits trailing behind it. Then it's off to a routine with one of the biggest 3D flying objects yet seen in any demo, simple yet devastatingly effective.

Following this there's a quick blast from the Virtual Worlds band. Again in 3D, the Poi Poi (I think that is what they are called) float around before settling down to play.

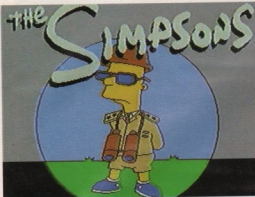

Then comes the second part of the demo, and the part that sets it aside from the rest. The year is 2019 and you are a special agent who has just returned from a failed mission on Mars. Your superiors are not very pleased with you and are sending you away on a simple mission that even you couldn't get wrong.

This is not a game, but a 3D visual experience. Look in awe as your craft leaves its hangar on its home planet and lifts off into the sky. It moves through space with a fleet of support craft before coming to the target planet where it navigates an asteroid belt.

It then enters the planet's atmosphere and drops an exploration shuttle

The story at the end of the demo, with the world, under the yellow banner, reflects its size

► into the water. The shuttle moves around looking at the various species that are living there. All this is shown in glorious 3D and, like the Phenomena demo before it, shows exactly what the Amiga can do – a visual treat well worth looking at.

The Simpsons by Decay: Alright, I know this isn't exactly new but it is so cool that it is well worth a mention in case you missed it first time round. It starts off with a pretty amazing advert for Coke. Then it launches into a great sample of The Bartman, that famous song that topped the charts not so long ago.

Great shape

There are some brilliant scenes from the Simpsons series. If you are even remotely sane then you simply must go for this demo.

Ice Demo by Silents: After some neat credit screens there are the obligatory rotating 3D shapes, but this time,

to be a little different, they are rotating over some wonderful static fantasy screens – great stuff.

Then the Silents take on Pygnosis at their own game, parallax scrolling a la Shadow of the Beast with the Ice shapes floating in the background along to some wonderfully atmospheric music.

More weird 3D rotating stuff follows – not exactly original but it is quite good. The demo ends up with some absolutely huge shapes rotating all over the place, with the mouse controlling the speed. The shapes include some familiar ones, like a Nintendo Game Boy for example.

System Violation: Introduced by some nice soothing music and rotating titles comes the new demo from anarchy. The action (if you can call it that) kicks off with some lovely routines with swirling dots and balls, all very nice to look at but it all boils down to, what's the point?

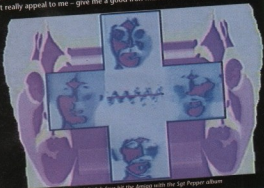

This is one of those demos that is

The Beatles

This has to be one of the strangest demos I have ever come across. It is the most headbustingly psychedelic demo ever. Based around the Beatles' classic Sgt Pepper's Lonely Hearts Club Band album, it has some of the music sampled onto it along with some images of the fab four.

All the images are colour cycled, easy to do but the effect gives a very 60's feel to it all. Time to get all the flower power clothes out again as all the old hippies are bound to get a bit nostalgic with this one. Unfortunately the copy I had seemed to enjoy crashing more than running but I am sure that this is just on my copy.

I would thoroughly recommend this disk to anyone who likes the Beatles, especially the weird stuff. Being too young to have been around in the sixties this doesn't really appeal to me – give me a good Iron Maiden demo any day.

The Beatles are back – the psychedelic fab four hit the Amiga with the Sgt Pepper album

spoiled by one thing – they seem to be obsessed with mentioning everybody on the entire planet somewhere on the disk, all very nice but very boring.

One of the stars of Lemmings narrowly misses being crushed by an avalanche of 3D spheres somewhere on the disk among all the credits and acknowledgments.

Invisible World demo: This wins the award for the dafdest slideshow ever. You must have seen those pictures

where they magnify something that is normally invisible to the naked eye about 300 times to make it look like some terrifying monster-type thing.

Well now there is a disk crammed full of the damned things. As if that wasn't enough there is also a section that has pictures that have been freeze framed, like a bullet going through a banana and things like that.

In fact bullets passing through objects feature quite heavily in this part of the demo. Go for this – it looks strange but fun.

After seeing a bed bug at 300 times its normal size you may think twice about ever going to bed again.

BEDBUG – A single bedbug can live for a year. This microvampire survives by piercing skin and sucking away a few drops of blood. Mag x300.

JUST HITE – Dependant on us for their survival, they live in our beds and upholstered furniture. They feed on our dead skin. Mag x250

Definitely the strangest slideshow around – give it a go

GURU-FREE ULTRA LOW NOISE DESIGN

Our Incredible TOTAL price includes the clock/date chip & 5 year easily replaceable battery.

£27.99

! TOTAL PRICE INCLUDING POSTAGE AND VAT !

A refreshing change from the dozens of amateur designed boards on the market - some even fit second hand, salvaged chips! Our is simply the best. A professional design from the makers of professional RAM expansions for more than 12 years. The AMIAMS-3 uses true, fast, top quality, brand new INTEL 286 RAM chips and has a 286 accurate clock. It is reliable, and has higher safety margins than any other product - to make those unexplained flashing hard Guru Boxes a thing of the past. What's more it is DESIGNED to accept a further 1Mb low cost L286 UPGRADE module. With the pedigree of its price, and a two year guarantee, who would consider any other?

ROCK LOBSTER

The Amiga Computing team
chill out...

PD winner - at last!

Hearty congratulations to Richard Town from Eland, the lucky winner

of our massive "Win a PD library" competition from way back in June.

Those awfully nice 17-Bit people will be in touch soon to arrange delivery of their entire library, so clear some space in your cupboards!

CITA winners

Space is short this month, and we haven't got room to reprint all the old CITA photos. So if you have your back issues handy it will all make sense, if not... you're kinda stuck.

The winner of CITA 38 was Fiona Clarridge from Oxford with "The other Lemmings will be along any minute".

CITA 39 was snapped up by Martin Gimes from Newcastle who identified Gazza and came up with the interesting caption of "How much will ya gimme to lift this up?".

Prizes will be in the post any month now. Watch out for the next Rock Lobster where we reveal the winner of CITA 40.

Real 3D rename

If you are having problems with our mega-generous Real-3D giveaway from last month, then read on.

Because of a teeny hiccup during the compilation of the disk, it has ended up on our cover with the wrong name.

Any readers following the Real 3D tutorial in the magazine will have been prompted to insert a disk called REAL. You don't have a disk called REAL yet, but it's easy to get one. Simply rename the disk we supplied and all will be well with the world.

Chart attack

How d'you you fancy a shot at redesigning one of the most popular music shows in Britain?

Next month Amiga

Computing and none other than The ITV Chart Show are offering an exclusive opportunity for you to do just that! If you fancy designing graphics that will be admired by over two and a half million viewers every week, the November issue of AC is an absolute must.

Take a peek at The Chart Show over the next few weeks to get a feel for what the graphics look and then get ready to totally redesign them.

There will be full details in next month's Amiga Computing so reserve yourself a copy now.

Can you do better than this? Try your luck next month... exclusively in AC

Also in next month's Amiga Computing...

November is going to be our biggest and best ever issue of AC, but what's it all about?

In a word - videographics. What are they? How do you design them and what is the best way to end up with a finished tape? We have loads of beginners' guides, hardware reviews and software roundups, not to mention a few tricks of the trade.

Also in November, for those with expansion in mind, a comprehensive look at hard disks, monitors and printers.

Add to all this a look at viruses and some of the sexiest hardware around and you have an issue of Amiga Computing that your newsgroup won't be able to get enough of. Reserve your copy now!

Lost winner

The AC office before we moved. Are you surprised that a winner went missing

Have you won an Amiga Computing competition and not received your prize yet?

During our office move - all of a painful 100 yards - we managed to "file" some correspondence so carefully that it hasn't turned up since. So, if you are still waiting, put the lawyers on hold and get on the phone or write in.

Build Muscle Power The AMIGA Way

- Is your Amiga always getting sand kicked in its face?
- Do other Amigas gang up on it and beat it up?
- In short, is your Amiga a 512k weakling?
- If so, then **Amiga Computing** has the answer.

Yes indeed Ladies and Gentlemen, without the aid of anabolic steroids you too can turn your feeble 512k Amiga into a lean, mean 1 Meg machine. How? By using the Microbotics M501 memory expansion board! Not only does this technological marvel share its name with a trendy make of jeans, it's also easy to install and comes with an inbuilt clock. The board can also be turned off to run 1/2 Meg only software and is fully compatible with all Amiga models.

Thus you can transform your Amiga into a powerful throbbing hunk of computer power, capable of making full use of such utilities as Real 3D, Can Do and other amazing Cover Disk freebies coming soon. And all for only **£29.99!**

How have you lived without it? At last your existence can have meaning. See the light brothers and sisters, fill in the form on page 177. You know it makes sense. Hallelujah!

THE COMPLETE COLOUR SOLUTION

Vidi ... No 1 in UK & Europe (Leading the way forward)

£179

Get the most out of your Amiga by adding:

"The Complete Colour Solution"

The Worlds ultimate creative leisure product for your Amiga. Capture dynamic high resolution images into your Amiga in less than one second.

And Look No Filters

Images can now be grabbed from either colour video camera, home VCR or in fact any still video source. The traditional method of holding three colour filters in front of your video camera is certainly a thing of the past. Because Vidi splits the RGB colours electronically there are no focussing or movement problems experienced by some of our slower competitors. Lighting is also less of an issue as light is not being shut out by lens filters. Put all this together with an already proven Vidi-Amiga/VidiChrome combination and achieve what is probably the most consistent and accurate high quality 4096 colour images ever seen on the Amiga.

The colour solution is fully compatible with all Amiga's from a standard A500 to the ultimate A3000. No additional RAM is required to get up and running.

You will see from independent review comments that we are undoubtedly their first choice and that was before the complete solution was launched. If you have just purchased your Amiga and are not sure what to buy next, then just read the comments or send for full review and demo disk.

Amiga Digitiser The best technicolour treatment. Vidi must be one of the most exciting peripherals you can buy for your Amiga.

"In the flesh" When I first saw Vidi show last September it looked to be the answer to a frustrated Dig View owner's dreams - in fact to see pictures appearing on screen without the customary two minutes wait seemed almost too good to be true. I have consistently produced more good quality pictures in the short time I have had Vidi than I ever did with Digiview.

Now under normal circumstances cheap usually means poor quality but this is not the case with Rombio. Why? cos Vidi-Amiga is the best digitiser for under £500 and I've tried them all.

Where quality is concerned, Vidi produces some of the best results I've seen on any digitiser at any price.

The latest addition to the Rombio is called Vidi-RGB and brings this already impressive package to the realms of totally amazing. CONCLUSION: Who will find Vidi almost anyone with a video recorder or camera and a passing interest in graphics.
