

Foreword

The papers in this special issue of **Biogeochemistry** comprise the recent research of a group of scientists studying the acidification of the Moose River system in the Adirondack Mountains of New York State. The journal is publishing these papers to emphasize and to help in integrating the multidisciplinary approaches of these researchers. The integration of the presentation of this research was greatly facilitated by a number of referees. In particular, Dr B. LaZerte of the Ontario Ministry of the Environment reviewed all of the papers and contributed importantly to their overall quality and consistency.
