Fig. 10 should appear:

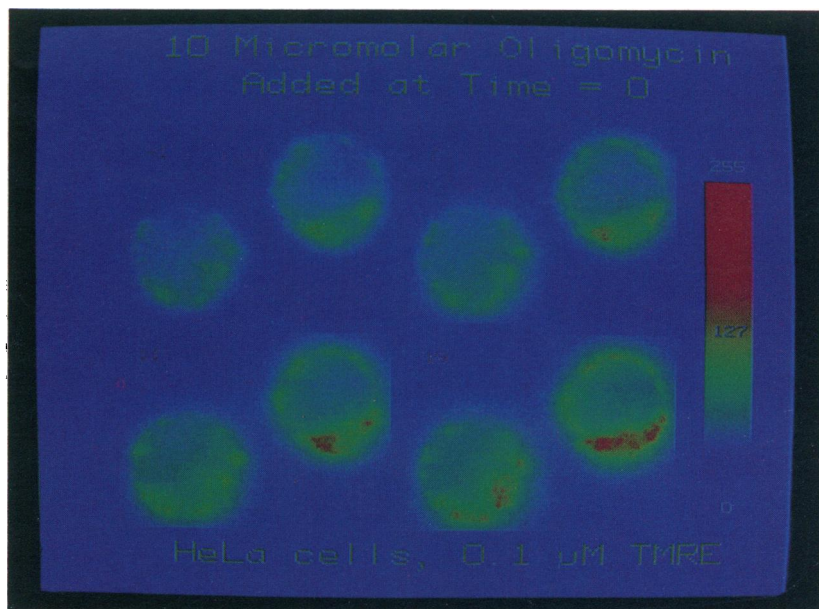

FIGURE 10 Effect of oligomycin on dye fluorescence in cells. HeLa cells incubated in 0.1 μ M TMRE in EBSS at 22°C were exposed to 10 μ M oligomycin at time $t = 0$. The fluorescence intensities are represented in pseudocolor, with the color scheme shown in the insert. The images correspond to $t = -1, 2, 11$, and 19 min. The regions turning from yellow to red after oligomycin addition correspond to the mitochondrial areas.
