Linda A. Shaw & Susan J. Coker Suppression of reperfusion-induced arrhythmics with combined administration of 5-HT₂ and thromboxane A₂ antagonists

In the above article, Figure 2 was published incorrectly owing to a typesetting error. The correct figure appears below.

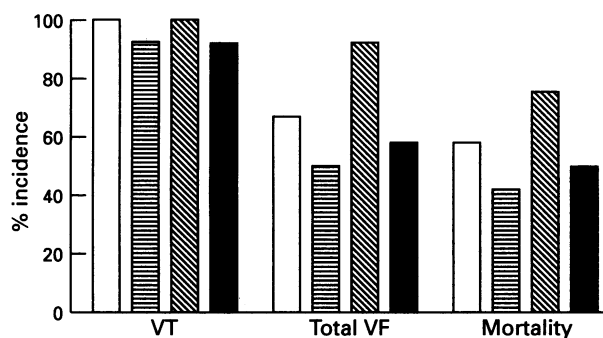

Figure 2 The incidence of reperfusion-induced ventricular tachycardia (VT), total ventricular fibrillation (VF) and the mortality (due to sustained VF) in the control group (open columns), and in rats which received the 5-HT₂ antagonist ICI 170,809 (0.3 mg kg⁻¹) alone (horizontally hatched columns), the thromboxane A₂ antagonist ICI 192,605 (0.3 mg kg⁻¹ min⁻¹) alone (diagonally hatched columns) and the combination of both drugs (solid columns). *n* = 12 per group.
