The title trisaccharide glycosides were needed for studies of the interactions of lectins, receptor sites for bacteriophages with *Salmonella* lipopolysaccharide core-specificity, and correlation of n.m.r. chemical shifts and structure.

The methods used in the syntheses were conventional. Thus, 2,3,4,6-tetra-*O*-benzoyl-*α*-D-mannopyranosyl bromide[1] was reacted with methyl 2,3,4-tri-*O*-benzyl-*α*-D-mannopyranoside[2] in dichloromethane in the presence of silver triflate[3,4] to yield the (1→6)-linked disaccharide derivative, catalytic hydrogenolysis of which gave 89% of **1**. Treatment of **1**, first with trimethyl orthoacetate, then with acetic anhydride followed by acidic opening of the cyclic 2,3-orthoester[5], afforded 94% of methyl 2,4-di-*O*-acetyl-6-*O*-(2,3,4,6-tetra-*O*-benzoyl-*α*-D-mannopyranosyl)-*α*-D-mannopyranoside (**2**). Glycosylation of the HO-3 of **2** with 2,3,4,6-tetra-*O*-benzyl-D-galactopyranosyl bromide[6] under halide-assisted conditions[7] afforded 83% of the trisaccharide derivative **3**, whereas the corresponding reaction of **2** with 2,3,4,6-tetra-*O*-benzyl-D-glucopyranosyl bromide[7] afforded 79% of **4**. Deprotection of **3** and **4** then gave the first two of the title trisaccharides, **5** and **6**.

Similarly, methyl 2-*O*-benzyl-4,6-*O*-benzylidene-*α*-D-mannopyranoside[8,9] was glycosylated with tetra-*O*-benzoyl-*α*-D-mannopyranosyl bromide[1] in dichloromethane in the presence of silver triflate to yield 82% of the (1→3)-linked disaccharide derivative **7**. Removal of the 4,6-*O*-benzylidene group of **7** by acid hydrolysis afforded 92% of **8**. Selective glycosylation of HO-6 in **8** with 2,3,4,6-tetra-*O*-benzyl-D-galactopyranosyl bromide[6] under halide-assisted conditions[7] gave 70% of the trisaccharide derivative **9** and glycosylation with 2,3,4,6-tetra-*O*-benzyl-*α*-D-glucopyranosyl bromide[7] gave 78% of **10**. The "open" strategy was preferred to more circuitous routes involving, for example, regioselective reductive opening of the 4,6-*O*-benzylidene acetal ring of **8**, to

EXPERIMENTAL

General methods. – These were the same as described[12,13]. ^{13}C-N.m.r. spectra for solutions in D_2O were obtained at 70° and referenced relative to internal acetone (δ 31.00).

Methyl 6-O-(2,3,4,6-tetra-O-benzoyl-α-D-mannopyranosyl)-α-D-mannopyranoside (**1**). — A solution of silver triflate (0.62 g) in toluene (4 mL) was added dropwise at 0° to a stirred mixture of methyl 2,3,4-tri-*O*-benzyl-α-D-mannopyranoside[2] (0.74 g) and 2,3,4,6-tetra-*O*-benzoyl-D-mannopyranosyl bromide[1] (1.5 g) in dichloromethane containing molecular sieves. The mixture was allowed to attain room temperature, then filtered through Celite, diluted with toluene, and washed with saturated aqueous sodium hydrogencarbonate and water, dried (Na_2SO_4), and concentrated. A solution of the residue in ethyl acetate (20 mL) was hydrogenolyzed in a Parr apparatus over 10% Pd–C (0.1g). After 2 days at 400 kPa pressure, the mixture was filtered and concentrated. Column chromatography (silica gel, 1:1 toluene–ethyl acetate) of the residue gave **1** (1.1 g, 89%), $[\alpha]_D$ –15° (*c* 1, chloroform). ^{13}C-N.m.r. data ($CDCl_3$): δ 55.0 (OMe), 62.8, 66.8, 67.6, 68.8, 70.4, 70.6, 70.9, 71.4, 72.2 (C-2,3,4,5,6, C-2′,3′,4′,5′,6′, one overlap), 97.6, 101.1 (C-1,1′), 128.3–133.4 (aromatic carbons), 165.5, 166.0, and 166.3 (carbonyl C).

Anal. Calc. for $C_{41}H_{40}O_{15}$: C, 63.7; H, 5.2. Found: C, 63.3; H, 5.5.

Methyl 2,4-di-O-acetyl-6-O-(2,3,4,6-tetra-O-benzoyl-α-D-mannopyranosyl)-α-D-mannopyranoside (**2**). — Trimethyl orthoacetate (1 mL) and *p*-toluenesulfonic acid (100 μL of a 5% solution in acetonitrile) were added to a solution of **1** (1.1 g) in acetonitrile (50 mL). After 5 min, pyridine (3 mL), acetic anhydride (3 mL), and a catalytic amount of 4-dimethylaminopyridine were added. When t.l.c. (toluene–ethyl acetate, 2:1) showed acetylation to be complete, the mixture was concentrated and co-concentrated twice with toluene. The residue was dissolved in acetonitrile (50 mL), aqueous 90% trifluoroacetic acid (100 μL) was added, and, after 15 min, the mixture was concentrated. Column chromatography (2:1 toluene–ethyl acetate) of the residue gave **2** (1.15 g, 94%), $[\alpha]_D$ −22° (*c* 1.3, chloroform). ^{13}C-N.m.r. data ($CDCl_3$): δ 20.9, 21.0 (CH_3CO), 55.3 (OMe), 62.8, 66.6, 66.8, 68.6, 69.0, 69.1, 69.6, 70.0, 70.4, 72.4 (C-2,3,4,5,6, C-2′,3′,4′,5′,6′), 97.6, 98.6 (C-1,1′), 125.8–133.5 (aromatic C), 165.3, 165.4, 165.5, 166.2, 170.8, and 171.1 (carbonyl C).
