(Received October 16, 1974)

There has been found a formic acid reaction of  $\alpha$ , N-diphenylnitrone which effects reduction together with introduction of hydroxyl group into a benzene ring, ortho to nitrogen function.

In a series of the formic acid reduction we now wish to describe our finding in the formic acid reaction of  $\alpha$ , N-diphenylnitrone, which is of interest in effecting reduction together with specific introduction of hydroxyl group into a benzene ring, ortho to nitrogen function.

The reaction was carried out by heating a solution of the nitrone dissolved in 99% formic acid at 145—150° in a zirconium-lined autoclave. Treatment of the reaction mixture gave N-benzyl-o-hydroxyformanilide in 36% yield. By the use of TEAF, which has been known³ as a distillable liquid formate given by 5HCO<sub>2</sub>H·2NEt<sub>3</sub>, in place of formic acid, the reaction under ordinary pressure could be carried out similarly, but resulted in a less yield of the product.

Very recently the reaction of N-aryl nitrones with oxalyl chloride has been reported<sup>4)</sup> to affect introduction of chloroglyoxalate grouping into ortho to the nitrogen. This paper suggests cyclic six centered transition state in intramolecular pathway for the reaction mecha-

nism. On referring to this paper the present reaction appears mechanistically to involve a similar path through I shown in Chart 1 before reduction.

Formic acid appeared to be a specific agent for the reaction, in view from inertness of acetic acid. Also aromatic amine N-oxide such as pyridine N-oxide and quinoline N-oxide were almost inert under the foresaid conditions.

## Experimental

All melting points are uncorrected. Infrared (IR) spectra were recorded with a JASCO IRA-2 Granting Infrared spectrophotometer. Nuclear magnetic resonance (NMR) spectrum was taken with a JEOL-C-60-H spectrometer (at 60 MHz).

Reaction of  $\alpha$ ,N-Diphenylnitrone with Formic Acid—A solution of 9.9 g (0.05 mole) of  $\alpha$ ,N-diphenylnitrone dissolved in 28 g of 99% formic acid was heated at 145—150° for 1.5 hr in a zirconium-lined autoclave. The reaction solution was concentrated under reduced pressure and the resulting residue was subjected to distillation under reduced pressure to give a solid distillate, bp 200—210° (0.2 mmHg). Recrystallization from benzene gave colorless prisms of N-benzyl-o-hydroxyformanilide, mp 118—120°. Yield, 4.1 g (36%). Anal. Calcd. for  $C_{14}H_{13}O_2N$ : C, 73.99; H, 5.77; N, 6.16. Found: C, 74.01; H, 5.76; N, 6.36. IR  $\nu_{\text{max}}^{\text{KBr}}$  cm<sup>-1</sup>: 3139(OH), 1641(CO), 741(o-substituted phenyl). NMR (10% CDCl<sub>3</sub> solution)  $\tau$ : 1.72 (1H, singlet, >N-CHO), 1.74—2.18 (1H, broads, OH), 2.85 (4H, singlet, aromatic protons), 3.22(5H, singlet, aromatic protons), 5.15 (2H, singlet,  $-\text{CH}_2$ -).

Reaction of  $\alpha$ ,N-Diphenylnitrone with TEAF—A solution of 9.9 g (0.05 mole) of  $\alpha$ ,N-diphenylnitrone dissolved in 42 g of TEAF (5HCO<sub>2</sub>H·2NEt<sub>3</sub>) was heated at 145—150°, whereupon considerable evolution of CO<sub>2</sub> was observed. Heating was continued until evolution of CO<sub>2</sub> almost ceased. After 1.5 hr's heating, the reaction solution was concentrated under reduced pressure to remove excess of TEAF. The resulting residue was subjected to a fractional distillation under 0.03 mmHg pressure. Trituration of the first fraction, bp ca. 125—130°, with iso-Pr<sub>2</sub>O gave o-aminophenol as fine crystals which were identified by comparison of its IR spectrum with that of an authentic sample. Yield, 0.5 g (9%). Plates (from ether), mp 165—167° (decomp.). By a similar manner N-benzyl-o-hydroxyformanilide was obtained from the third fraction, bp 188—190°. This material was recrystallized from benzene to form colorless prisms, mp 119—120°, weighing 2.0 g, which were identified by comparison of its IR spectrum with that of the authentic specimen obtained in the above. The second fraction, bp ca. 140—155°, combined with the above triturating liquids was subjected to silica gel column chromatography using iso-Pr<sub>2</sub>O as an eluent. From earlier fractions there was obtained N-benzylformanilide, mp 45—47°, identified by comparison of its IR spectrum with that of an authentic specimen. Yield, 3.0 g (28%). From later fractions 0.5 g of additional N-benzyl-o-hydroxy-formanilide was obtained. Total yield, 2.5 g (22%).

Acknowledgement We wish to thnak Mr. K. Narita and other members of the Analysis Center of this college for microanalyses and spectral measurements.
